Hendrickson has added a shear-type bolt and a second washer to the lower shock absorber connection. To apply the proper torque, the washers must be installed on both sides of the shock absorber and the shear-type bolt must be tightened until the bolt's Torx head shears off. Use an E20 Torx socket to tighten and shear the bolt. Torx head separation will occur between 210 - 235 ft. lbs. (285 - 318 N·m) of torque. Failure to follow these instructions could result in damage to the suspension and/or its components.
