CONVENTIONS APPLIED IN THIS DOCUMENT
This section explains techniques used in this document to convey important information, safety issues, how to contact Hendrickson and how to apply hyperlinks.

EXPLANATION OF SIGNAL WORDS
Hazard signal words (such as DANGER, WARNING or CAUTION) appear in various locations throughout this publication. Information accented by one of these signal words must be observed at all times. Additional notes are utilized to emphasize areas of procedural importance and provide suggestions for ease of repair. The following definitions comply with ANSI Z535.4 and indicate the use of safety signal words as they appear throughout the publication.

⚠️ DANGER: INDICATES IMMEDIATE HAZARDS WHICH WILL RESULT IN SEVERE PERSONAL INJURY OR DEATH.

⚠️ WARNING: Indicates hazards or unsafe practices which could result in severe personal injury or death.

⚠️ CAUTION: Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

NOTICE: Indicates hazards or unsafe practices which could result in damage to machine or equipment.

IMPORTANT: An operating procedure, practice or condition that is essential to emphasize.

⚠️ Safety alert symbol used to indicate a condition exists that may result in personal injury or harm to individuals. It must be applied to DANGER, WARNING and CAUTION statements, which emphasize severity.

IMPORTANT SAFETY NOTICES
Safety and precautionary statements are listed in Hendrickson literature number T12007 and available at www.Hendrickson-intl.com/TrailerLit.

Links and cautions should be read carefully to help prevent personal injury and to assure that proper methods are used. Improper maintenance, service or repair can cause damage to the vehicle and other property, personal injury, an unsafe operating condition and potentially void the manufacturer’s warranty.

LINKS
Links are identified by a dark grey line under the linked text. Internal links allow the reader to jump to a heading, step or page in this document. External links open the website or document referenced.

GENERAL SERVICE NOTES
Proper installation, maintenance, service and repair is important to the reliable operation of the suspension system. The procedures recommended by Hendrickson and described in this publication are methods of performing inspection, maintenance, service and repair.

Before you begin:
Read, understand and comply with:
• All instructions and procedures.
• All signal word (CAUTION, WARNING and DANGER) statements to help avoid personal injury or property damage.
• Company’s maintenance, service, installation and diagnostic practices.
• Vehicle manufacturer’s safety instructions when working on the vehicle.
• Vehicle manufacturer’s instructions for recommended practices not described in this manual.
• Local safety regulations.

DURING SERVICE:
• Work must be carried out by trained personnel.
• Sudden release of parking springs (e.g. the spring brake part of the brake chamber or the brake return spring) may cause injury.
• Use recommended tools only.
• Before releasing trailer back into service, perform operational checks and test the trailer to ensure brakes are working correctly.

Hendrickson reserves the right to make changes and improvements to its products and publications at any time. Consult the Hendrickson website (www.hendrickson-intl.com) for the latest version of this manual.

NOTICE: Accessory-type hubcaps, such as the chrome “top hat” style hubcap, can potentially increase wheel-end temperatures during operation and are not recommended for use on Hendrickson extended-service wheel ends.
CONTACTING HENDRICKSON

Contact Hendrickson Trailer Technical Services for technical assistance as needed. To do so, several options are available. Technical Services must be contacted before performing any warranty related service.

Prior to contacting Technical Services, it is best to have the following information about the vehicle and Hendrickson suspension available (all that apply):

- Suspension ID Tag information (Refer to Hendrickson Literature Number L977 Trailer Suspension and Axle ID Guide, for ID tag location and details):
  - Suspension model number
  - Suspension serial number
  - Approximate number of suspension miles

- VIN plate data. Refer to trailer OEM manual for VIN plate location.
  - Trailer Type (van, reefer, flat bed, etc.)
  - Manufacturer
  - VIN (vehicle identification number)
  - In-service date

- If applicable, description of the system problem, part number and/or part description of the reported non-functioning part.
  - Date of problem
  - Where applicable: location of problem on suspension / trailer (e.g., road side, front axle, rear axle, curb side rear, etc.)
  - Symptoms:
    » Systems, components or function affected by the problem.
    » When does the problem occur?
    » How often does the problem occur?
    » Etc.

- Any troubleshooting and/or measurements have been performed.
- Digital photos of suspension and damaged areas.
- Special application approval documentation (if applicable).

EMAIL

To contact Hendrickson Trailer Technical Services, use the following e-mail address:

HTTS@Hendrickson-intl.com

PHONE

Contact Hendrickson directly in the United States at 866-RIDEAIR (743-3247). From the menu, select:

- Technical Services/Warranty for technical information.
- Other selections include:
  - Aftermarket Sales for replacement parts information and ordering.
  - Original Equipment Sales for parts inquiries and ordering for trailer manufacturers.

RELATIVE LITERATURE

If you suspect your version of this or any other Hendrickson manual is not “Up-to-Date”, the most current version is free online at:

www.hendrickson-intl.com/TrailerLit

Available Hendrickson documentation can be viewed or downloaded from this site.

Other relative literature may include:

If the in-service date is unknown or not available, the vehicle date of manufacture can be substituted.
PREPARING TRAILER FOR SERVICE

NOTE: DO NOT service a suspension or any components that is under warranty without first contacting Hendrickson Technical Services. Refer to CONTACTING HENDRICKSON for details.

WARNING: Do not work under a trailer supported only by jacks. Jacks can slip or fall over, resulting in serious personal injury. Always use safety stands to support a raised trailer.

INTRODUCTION
The HVS® Hendrickson Value System™ hub assembly (Figure 1) comes pre-assembled, adjusted and lubricated from Hendrickson. Because we control the assembly, internal cleanliness, bearing adjustment and seal installation in our facilities, we can offer premium performance and an extended-service warranty on these hub assemblies.

The HVS system is available with ductile iron, aluminum or Dura-Light Hub® that are field serviceable with Hendrickson authorized components. However, DO NOT remove the HVS hubcap or attempt any kind of field service without first CONTACTING HENDRICKSON Technical Services. Wheel-end repairs performed prior to contacting Hendrickson Technical Services voids the warranty. Refer to L583 for details.

NOTE: Hendrickson recommends HP spindle type for offset super single tire applications. Refer to Hendrickson literature number L846 Wide Base Tire Configurations for more details. The HN spindle design is not approved for use with any offset single wheel.

Figure 1: HVS® Hendrickson Value System™ wheel-end parts identification
**TOOLS REQUIRED**
The following tools may be required during the performance of some maintenance procedures:

<table>
<thead>
<tr>
<th>TOOL 1</th>

<td>End-play measurement. Refer to Figure 4 on page 7.</td>
</tr>
</tbody>
</table>

**Table 2: List of required tools**

**IMPORTANT:** Torque (Table 4 on page 14) cannot be properly applied with an ordinary wrench. A calibrated torque wrench must be used to tighten fasteners to specified values.

**INSPECTION**
At regular intervals, the HVS® hub assembly should be checked for seal leaks and smooth rotation.

**WARNING:** Prior to performing inspection procedures, help ensure conditions are safe by following steps in section PREPARING TRAILER FOR SERVICE.

**NOTE:** Recommended inspection intervals are based on an average trailer usage of 100,000 miles (160,000 km) per year. Higher usage would require more frequent inspections. Refer to Hendrickson literature number L578 Suspension Preventive Maintenance Guide for more details.

Inspections should be performed:
- **Daily** pre-operation check. This would include a general walk around to check for signs of obvious damage, wear or other abnormalities.
- **Every month,** visually inspect back of hub and hubcap gasket for leakage. Refer to the section titled CHECKING FOR SEAL LEAKS for complete inspection details.

**CHECKING FOR SEAL LEAKS**
The HVS® hub assembly is filled with oil at the factory during the assembly process. Oil is contained in the hub by the hub seal where leakage can occur (Figure 1 on page 5).

To check for leaks, look at the inboard side of the hub, (Figure 2). A small amount of oil may be visible at the hub seal. This is a normal occurrence and does not necessarily indicate a seal leak. Wipe clean.
A small amount of oil may also appear at the spindle bearing shoulder to hub joint and hubcap gasket (Figure 3). This is also normal and does not necessarily indicate a leak. It should be wiped clean to minimize any accumulation of dirt.

**NOTICE:** Pressure or steam washing should be avoided in this area as water could be forced past the seal and degrade lubricant performance and corrode bearings.

If the hub seal or gasket is leaking, a large quantity of oil will be present in the areas of the hub, spindle hubcap and wheel. If found, refer to CONTACTING HENDRICKSON Technical Services for guidance on how to proceed.

**CHECKING FOR SMOOTH ROTATION**

Many factors can effect smoothness of rotation. Primary causes include:

- Bearing wear
- Damaged hub seal
- Debris

**NOTE:** A reasonable assessment can be performed without removing tires and rims. However, this procedure is best performed with hub only as shown in Figure 5.

1. Ensure trailer is secure per PREPARING TRAILER FOR SERVICE on page 5.

2. Disengage brakes and remove brake drum (recommended).

3. While maintaining physical contact, slowly rotate hub in both directions at least five revolutions.

4. During rotation, ensure smooth and quiet rotation. Bearings should move smoothly. Feel for any resistance in movement. Any debris in bearings should be felt or heard as it moves over rollers in bearings.

**IMPORTANT:** If bearings feel rough, sound noisy or DO NOT rotate freely, DO NOT place the suspension back into service. Refer to CONTACTING HENDRICKSON Technical Services for guidance.

### CHECKING END PLAY

This procedure must be performed:

- After CONTACTING HENDRICKSON Technical Services, before removing the hubcap, for guidance relative to suspected wheel end play movement.
- As part of INSTALL 3-PIECE SPINDLE NUT on page 10.

1. If not already done so:
   A. Perform PREPARING TRAILER FOR SERVICE on page 5
   B. Remove wheel (tires and rims).
   C. Drain oil from wheel end.
   D. Disengage brakes and remove drum (recommended).
   E. Remove hubcap and discard gasket.

**IMPORTANT:** End play can be checked with brake drum installed or removed (preferred). If installed, ensure all brake drum wheel fasteners are installed and tightened to manufacturers specifications before checking end play.

2. Ensure hub hubcap mounting surface and end of spindle are clean and totally free of any burrs or debris.

3. Rotate hub at least 5 revolutions to ensure bearings are fully seated.

**NOTE:** The hub MUST be rotated before performing end play measurement. Rotation works the rollers into their fully seated positions against the bearing cone shoulder. **Failure to rotate hub could result in a false end play reading.**
4. Attach dial indicator (Table 2) with magnetic base to flat surface at end of spindle (Figure 4).

5. Adjust dial indicator so its pointer line of action is parallel to spindle axis and touches hub’s hubcap mounting surface. Ensure the plunger contacts the hub on a surface that is smooth and fully machined. Any regions with scratches, gouges or non-cleanup should be avoided.

6. Check indicator for free movement in both directions. Lightly push and pull on indicator arm to verify plunger is free to move at least .005” in each direction. If indicator bottoms out, readjust until it is free to move .005” in both directions.

7. Zero indicator.

8. Grasp hub flange, as shown in Figure 5, and push the hub inward while rotating the hub slightly in both directions (15 - 30° between two holes) until the dial indicator reading remains constant. Record reading.

9. While still grasping hub (Figure 6), pull hub outward while rotating hub slightly in both directions (15 - 30° between two holes) until dial indicator reading remains constant. Record reading.

10. End play is the total movement of the indicator. Calculate difference between recorded values of Step 8 and Step 9 to determine end play, record value.

**IMPORTANT:** End play must be between 0.001” (0.0254 mm) and 0.005” (0.0127 mm). If subsequent readings are necessary, the hub must be rotated at least 5 revolutions to reseat the bearings (refer to Step 3).

A. If checking after INSTALL 3-PIECE SPINDLE NUT on page 10, return to Step 10.

B. If end play is more than 0.005” (0.127 mm). Refer to CONTACTING HENDRICKSON Technical Services for guidance on required next steps.

**IMPORTANT:** If end play is not within specifications, **DO NOT** place suspension back into service without correcting the problem.

C. If end play is within specification, no bearing adjustment is necessary. Continue to next step.

11. Refer to Figure 9 on page 10 and check to ensure:

   A. Adjusting nut is secure
   
   B. Lock washer and tang are properly seated
   
   C. Outer jam nut and retaining set screw are securely in place (Figure 9 on page 10).
   
   D. If not already done so, perform CHECKING FOR SEAL LEAKS on page 6.

12. Go to INSTALL HUBCAP on page 12.
**REMOVING AND INSTALLING HUB**

**IMPORTANT:** To ensure continued warranty, **DO NOT** perform the following procedures without obtaining prior authorization by CONTACTING HENDRICKSON Trailer Technical Services.

**WARNING:** Prior to performing maintenance procedures, ensure conditions are safe. Refer to PREPARING TRAILER FOR SERVICE on page 5.

**HUB REMOVAL**

Only after receiving proper authorization from Hendrickson Technical Services, use the following procedure to remove HVS® hub assembly:

1. Remove tire / wheel assembly.
2. Disengage brakes and, remove brake drum.
3. Drain oil from wheel end and discard.
4. Remove hubcap screws (Table 2) and hubcap, discard gasket.
5. Using a 5/64 inch hex key, remove set screw from lock washer (Figure 1 on page 5 and Figure 9 on page 10).
6. Remove spindle nuts and lock washer.
7. Carefully pull HVS hub assembly slightly toward spindle end. A short quick motion should allow outer bearing to exit the hub. Be prepared to catch outer bearing if it slides off the end of the spindle. Otherwise, simply remove it.
8. Remove hub from spindle. The inner bearing is held in hub by the hub seal and should come off with hub.
9. Remove and discard hub seal:
   A. **If the seal is in the hub** - a pry bar can be used to carefully remove the seal from the hub bore. Damage to hub and hub surfaces must be avoided.
   B. **If the seal is on the spindle** - Using a brass, leather or other soft-faced mallet, drive the seal off the spindle by carefully striking the seal from the back side.

**NOTICE:** Any damage to the spindle’s machined surfaces can effect wheel end performance.

10. Remove, clean and inspect inner bearing. Replace if needed.

**SPINDLE PREPARATION**

Before installing or re-installing the hub, follow this procedure to ensure spindle machined surfaces are clean and undamaged.

**CAUTION:** For safety reasons, to prevent injury and damage to the hub and spindle, lifting equipment may be required to lift and support the hub as it is being installed onto the spindle.

1. Remove old lubricant and thoroughly clean spindle.
2. Inspect machined spindle journals (Figure 7) for nicks, scratches, burrs or marks. If needed, use crocus cloth or emery cloth to repair any damaged areas.
3. Clean spindle threads and keyway thoroughly with a wire brush to avoid false bearing adjustments and to avoid introduction of contaminants into the lubricant cavity.
4. Thoroughly clean spindle machined surfaces of rust, dirt, oil or any other contaminants that could damage the hub seal and cause it to leak.
5. Lubricate spindle bearing surfaces with clean oil.

**NOTICE:** To minimize fretting and damage to wheel-end, lubricate all components and applicable surfaces using the same lubricant.

**PREPARE AND INSTALL HUB**

If installing new hub, start with Step 2.

1. Thoroughly clean the hub bore of any dirt, oil, rust or any other substance that may be present.
2. Remove all sharp edges, nicks and burrs from seal bore, hubcap bore and hubcap mounting surface of the hub.
3. **Inspect** hub seal bore for roughness. If needed, use emery cloth to remove any burrs or old bore sealant and wipe hub clean.

4. **Ensure** hubcap mounting surface is smooth and free of debris.

5. **Apply** lubricant to inner bearing.

6. **Install** inner bearing into hub (Figure 1 on page 5).

7. **Lubricate** seal according to seal manufacturer’s recommendations.

8. **Place** seal onto the drive tool (Figure 8) for installation into the hub according to seal manufacturer’s instructions.
   
   A. **Align** seal tool with hub seal bore.
   
   B. **Drive** seal until it bottoms out in the hub seal bore.
   
   C. **Rotate** installation tool and apply several light blows to ensure seal is properly seated.
   
   D. **Check** inner bearing to ensure it rotates freely.

9. Slide hub onto spindle, taking care not to damage seal.

   **NOTICE:** The HUB SEAL CAN BE DAMAGED if:
   
   - Hub seal is improperly installed.
   
   - Hub seal is rammed into the spindle bearing shoulder.
   
   - Hub is not kept supported and aligned with spindle until the outer bearing and axle nut are installed.

10. **Lubricate** outer bearing and install into hub.

11. **Clean** as needed to remove grease from unwanted areas.

   **NOTE:** While sliding hub onto spindle, grease is collected at the spindle seal journal inboard of the hub (Figure 7 on page 9). This may be later interpreted as a grease leak and should be cleaned.

**INSTALL 3-PIECE SPINDLE NUT**

The HVS® hub system uses a 3-piece spindle nut system (Figure 9).

---

![Figure 8: Hub-mounted seal installation](image)

**Figure 8: Hub-mounted seal installation**

**NOTE:** A hub seal driver (Figure 8) is recommended and can be obtained from seal manufacturer.

![Figure 9: 3-piece nut system components](image)

**Figure 9: 3-piece nut system components**

---

T72005 B
1. Install inner adjusting nut (Figure 10) on spindle, dowel side out, and tighten to 200 ft-lbs (271 Nm) of torque while rotating wheel.

2. Back off inner adjusting nut one full turn.

3. Rotate wheel at least 5 revolutions to seat bearings.

4. Tighten inner adjusting nut to 50 ft-lbs (68 Nm) of torque while rotating wheel.

5. Back off the inner adjusting nut ¼ turn.

6. Install lock washer (Figure 10). Ensure lock washer tang fits in the spindle keyway slot and inner adjusting nut dowel fits in one of the holes in the lock washer. If this alignment cannot be achieved, remove the lock washer, flip it over and reinstall it on spindle (Figure 11).

7. Install outer jam nut (Figure 1 on page 5).

8. Tighten outer jam nut to:

<table>
<thead>
<tr>
<th>SPINDLE</th>
<th>TORQUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>HN</td>
<td>315 ft-lbs (427 Nm)</td>
</tr>
<tr>
<td>HP</td>
<td>385 ft-lbs (522 Nm)</td>
</tr>
</tbody>
</table>

Table 3: Outer jam nut torque values.

9. Perform CHECKING END PLAY on page 7. Return with the recorded end play value to determine how to proceed.

10. Perform CHECKING END PLAY on page 7. Return with the recorded end play value to determine how to proceed.

**IMPORTANT:** End play must be between 0.001” (0.0254 mm) and 0.005” (0.0127 mm).

A. If end play is within specifications, go to next step to install set screw.

B. If excessive end play (greater than 0.005”).
   i. Remove outer jam nut (Figure 9).
   ii. Pull lock washer away from hub, but not entirely off the spindle.
   iii. Tighten inner nut so its dowel aligns with the next alignment hole in the lock washer.
   iv. Slide lock washer up against inner nut and install outer jam nut.
   v. Tighten jam nut according to Table 3.
   vi. Recheck wheel bearing end play. Continue to adjust until end play is within the range specified, then go to Step 11.
i. **If insufficient end play** (less than 0.001 “):

   i. Without rotating wheel, remove outer jam nut.

   ii. Pull lock washer away from hub, but not entirely off spindle.

   iii. Loosen inner adjusting nut so its dowel aligns with the previous alignment hole in lock washer.

   **NOTE:** If a smaller loosening increment is desired, remove lock washer from spindle, flip it over, reinstall it on spindle and loosen inner adjusting nut so its dowel aligns with the previous alignment hole in lock washer (Figure 11).

   iv. Slide lock washer up against inner adjusting nut and install outer jam nut. Tighten nut according to Table 3.

   v. Repeat **CHECKING END PLAY** on page 7, starting at Step 3.

11. **Install set screw** (Figure 1 on page 5) into an accessible threaded hole in lock washer (Figure 9). Set screw must contact inner adjusting nut. Tighten to 18±2 in. lbs. (2.0±0.2 Nm) of torque.

**INSPECTING INSTALLATION**

To ensure correct installation, follow these procedures:

1. **Ensure** lock washer is properly positioned and flush with inner adjusting nut at dowel pin (Figure 9 and Figure 11).

2. **Ensure** set screw contacts nut face. When properly installed, the set screw will be approximately half the height of the outer jam nut.

3. Test for free hub rotation, perform **CHECKING FOR SMOOTH ROTATION** on page 7.

**INSTALL HUBCAP**

After the hub installation and inspection is complete, the hubcap can be installed.

**IMPORTANT:** Always install a new gasket when reinstalling hubcap.

**NOTICE:** Interference between nut system and hubcap could occur if improper components are used. Use only genuine Hendrickson or Hendrickson approved replacement components. Refer to **RELATIVE LITERATURE** on page 4 or **CONTACTING HENDRICKSON** on page 4 as needed.

1. Visually inspect hubcap, hub mating surface, bolt holes and new gasket for:
   - Signs of damage
   - Debris, such as silicon gasket sealer
   - Burs or sharp edges
   - Cracks

2. Clean, repair or replace as needed.

3. Align hubcap and new gasket onto hub and insert screws.

5. Using a star pattern, torque hubcap screws to 15±3 ft. lbs. (20±4 Nm) torque.

**NOTICE:** **DO NOT overtighten hubcap screws.** Overtightening will distort metal hubcap mounting flange, which will prevent hubcap from achieving a leak-free seal.
**ADDING OIL LUBRICANT**

Oil lubricant must be added after hub assembly and as needed. SAE 75W-90 synthetic gear lubricant or SAE 80W / 90W gear oil is approved for use in the HVS® wheel-end hub.

**IMPORTANT:** Use of improper lubricants or maintenance procedures can void the wheel-end warranty.

**NOTICE:** To minimize fretting and damage to wheel-end, lubricate all components and applicable surfaces using the same lubricant.

1. **Remove** fill port plug on the side of the hub (Figure 1 on page 5), hubcap or at hubcap window plug (Figure 12).

   ![Side lube fill port, with plug](Image)
   ![Hubcap window fill port, with plug](Image)
   ![Oil level indicator window](Image)

   **Figure 12:** HVS oil hubcap with oil level indicator window

   **NOTE:** Not all hubs have a fill port. In this case, oil can only be added through the hubcap side or window lube fill port (Figure 12).

2. **Fill** wheel end with SAE 75W-90 synthetic gear lubricant or SAE 80W / 90W gear oil to “FULL” line on hubcap window.

   **NOTE:** Allow sufficient time for oil to settle prior to final oil level check (it may be necessary to add oil more than once to adequately fill the wheel end).

   **IMPORTANT:** The oil level should be maintained to the hubcap full line (Figure 12). Adding oil above the hubcap full line should be avoided.

3. **Check** oil level at hubcap window (Figure 12).

4. **If** oil was inserted through fill port in hub, **Install** fill port plug and tighten to 22±2 ft. lbs. (30±3 Nm) torque.

   **If** oil was inserted through **hubcap** side fill port, **Install** fill port plug and tighten to 7±2 ft. lbs. (9±3 Nm) torque.

   **Otherwise,** reinstall hubcap oil plug in window.

5. **Spin hub** more than three revolutions to distribute oil.

**COMPLETING INSTALLATION**

1. **Spin hub** more than three revolutions to distribute lubricant equally in hub bore.

2. **Install** brake drum

3. **Install** wheel (tire and rim assembly) Refer to Brake DRUM AND WHEEL ASSEMBLY in Hendrickson literature number T82006 Stud Replacement Procedures.

4. **If** service is complete, **restore** trailer to normal operation.

1 These fasteners are incrementally tightened according to procedures defined in this manual and superseded by OE documentation, where applicable. Refer to decal T70013 Wheel Assembly Procedure.
2 Re-torque all wheel nuts after 50 to 100 miles of service.

Table 4: HLS® Wheel-end fastener torque values

WHEEL STUD REMOVAL AND INSTALLATION PROCEDURE
Refer to Hendrickson literature number T82006 Stud Replacement Procedures for detailed instructions on wheel stud removal.
