Maintains ride height during loading and unloading

When maintaining deck height is not critical but eliminating trailer walk is still important, Hendrickson offers automatic and manual dump valves. These pneumatic controls prevent trailer walk by exhausting air bags, thereby lowering the trailer onto the internal air spring bumpers. Hendrickson offers a number of solutions for safe and efficient trailer dock operations, preventing both trailer drop and walk. These solutions work in combination with VANTRAAX[®] and INTRAAX[®] integrated suspension systems and HT[™] Series top-mount suspensions for years of reliable and maintenance-free service.

Eliminates trailer walk and trailer drop

SURELOK[®] features locking legs that provide maximum engagement with the suspension beam. A robust return spring enhances durability and a metal "flange" at the bottom rear of each SURELOK leg ensures proper positioning. SURELOK is designed for the customer who must maintain ride height during loading and unloading. Since the trailer is rigidly supported, dock-walk is also eliminated. Supports are automatically engaged when the trailer's parking brakes are set. When the parking brake is released, SURELOK's support legs automatically retract. No driver interaction is required.

Hendrickson offers a variety of solutions tailored to meet your specific needs.

Loading Dock Solutions

- 1. Trailer Drop and Walk** — SURELOK® is recommended for maintaining current ride height when the operator cannot afford to allow the trailer to drop three inches (normal up travel) for efficient trailer dock operations. A second benefit of SURELOK is minimizing trailer walk by limiting vertical and horizontal movement.
- 2. Trailer Walk** — When maintaining ride height is not a concern but trailer walk is, Hendrickson recommends dump valves.

For additional information refer to the following Hendrickson publications:
