SECTION 1
Introduction

This publication is intended to acquaint and assist maintenance personnel in the preventive maintenance, service, and repair of the ULTIMAAX® rear suspension system for applicable International Truck vehicles operated in Mexico, Central and South America.

NOTE

Use only Hendrickson Genuine parts for servicing this suspension system.

It is important to read and understand the entire Technical Procedure publication prior to performing any maintenance, service, or repair of this product. The information in this publication contains parts lists, safety information, product specifications, features, proper maintenance, service, and repair instructions for ULTIMAAX suspensions.

Hendrickson reserves the right to make changes and improvements to its products and publications at any time.

Contact Hendrickson Tech Services for information on the latest version of this manual at Hendrickson Mexicana (442) 296.3600 or e-mail: serviciostecnicos@hendrickson-intl.com.

The latest revision of this publication is available online at www.hendrickson-intl.com.

SECTION 2
Product Description

ULTIMAAX® is an advanced severe-duty rear rubber suspension designed to balance outstanding durability, empty ride quality, loaded stability and mobility. Through its unique design, the system offers premium ride quality in both empty and loaded conditions, with increasing stability as the load increases. The ULTIMAAX system is capable of extremely high articulation for demanding job-site or off-highway conditions. When loaded, it delivers up to 17.5” of diagonal wheel articulation.

- **Equalizing beam** — Formed and robotically welded to provide a narrow profile for weight savings. Distributes load equally between axles to improve maneuverability, stability and handling. Increases ground clearance with flat bottom design. Lowers the center of gravity to increase stability.

- **Frame hangers** — Optimized design to balance durability and weight savings. Fabricated to offer flexibility with multiple truck configurations.

- **Premium rubber bushings** — Require no lubrication. Extend service life and reduce re-bush time with rugged bar pin axle connection. Improve articulation with a high performance design.

- **Progressive load springs** — Designed to balance empty ride quality and loaded stability. Stiffness of progressive load spring increases as load increases, providing a unique balance of empty ride quality and loaded stability.

- **Rubber shear springs** — Primary springs in unloaded condition, providing superb ride quality. React to longitudinal loads during braking and accelerating for minimal displacement.

- **Saddle** — Triangular geometry provides structure and durability. Weight efficient design helps to increase payload, while offering a considerable weight savings versus competitive suspensions.

- **Torque rods** — Longitudinal rods are engineered to optimize resistance to axle wind-up during acceleration and braking. **Transverse torque rods** ensure maximum lateral axle control and straight line suspension stability.

Hendrickson approves the use of ULTIMAAX in the following vocational truck applications: dump, concrete mixer, refuse, logging, crane / boom, platform and fire / rescue. All such applications must comply with applicable Hendrickson specifications and must also be approved by the respective vehicle manufacturer with the vehicle in its original, as-built configuration. Contact Hendrickson and the respective vehicle manufacturer for approval of additional applications.

1. Installed weight includes full suspensions with torque rods and without shocks.
2. Job-Site travel rating – operators using vehicles equipped with liftable pusher or tag axles must not exceed published ratings. Job-site ratings are limited to no more than five percent of vehicle operation at speed not to exceed five mph. Liftable pusher or tag axles should only be raised (or unloaded) to improve vehicle maneuverability in job-site applications or when vehicle is empty. Job-site travel ratings are consistent with published axle manufacturer’s limitations. Axle and suspension job-site travel specifications must not be exceeded.
3. Suspension articulation may exceed vehicle’s capability and may be limited by vehicle manufacturer; vehicle manufacturer installed axle stops may restrict suspension’s articulation.
4. Contact Hendrickson for availability of additional beam lengths.

Actual product performance may vary depending upon vehicle configuration, operation, service and other factors.

U.S. and foreign patents granted and / or pending.
SECTION 3
Important Safety Notice

Proper maintenance, service and repair are important to the reliable operation of the suspension. The procedures recommended by Hendrickson and described in this technical publication are methods of performing such maintenance, service and repair.

This technical publication should be read carefully to help prevent personal injury and to assure that proper methods are used. Improper maintenance, service or repair may damage the vehicle, cause personal injury, render the vehicle unsafe in operation, or void the manufacturer's warranty. Failure to follow the safety precautions in this manual can result in personal injury and/or property damage. Carefully read and understand all safety related information within this publication, on all decals and in all such materials provided by the vehicle manufacturer before conducting any maintenance, service or repair.

EXPLANATION OF SIGNAL WORDS

Hazard "Signal Words" (Danger • Warning • Caution) appear in various locations throughout this publication. Information accented by one of these signal words must be observed to help minimize the risk of personal injury to service personnel, or possibility of improper service methods which may damage the vehicle or render it unsafe.

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

Additional Notes or Service Hints are utilized to emphasize areas of procedural importance and provide suggestions for ease of repair. The following definitions indicate the use of these signal words as they appear throughout the publication.

**DANGER**
INDICATES AN IMMINENTLY HAZARDOUS SITUATION, WHICH IF NOT AVOIDED, WILL RESULT IN SERIOUS INJURY OR DEATH.

**WARNING**
INDICATES A POTENTIAL HAZARDOUS SITUATION WHICH, IF NOT AVOIDED, CAN RESULT IN SERIOUS INJURY OR DEATH.

**CAUTION**
INDICATES A POTENTIAL HAZARDOUS SITUATION WHICH, IF NOT AVOIDED, MAY RESULT IN MINOR OR MODERATE INJURY.

**NOTE**
An operating procedure, practice condition, etc. which is essential to emphasize.

**SERVICE HINT**
A helpful suggestion that will make the service being performed a little easier and/or faster.

Also note that particular service operations may require the use of special tools designed for specific purposes. These special tools can be found in the "Special Tools" Section of this publication.

The torque symbol alerts you to tighten the fasteners to a specific torque value. See Torque Specifications Section of this publication.
SAFETY PRECAUTIONS

FASTENERS

**WARNING**

DISCARD USED FASTENERS. ALWAYS USE NEW FASTENERS TO COMPLETE A REPAIR. FAILURE TO DO SO COULD RESULT IN FAILURE OF THE PART, OR MATING COMPONENTS, ADVERSE VEHICLE HANDLING, PERSONAL INJURY, OR PROPERTY DAMAGE.

LOOSE OR OVER TORQUED FASTENERS CAN CAUSE COMPONENT DAMAGE, ADVERSE VEHICLE HANDLING, PROPERTY DAMAGE, OR SEVERE PERSONAL INJURY. MAINTAIN CORRECT TORQUE VALUE AT ALL TIMES. CHECK TORQUE VALUES ON A REGULAR BASIS AS SPECIFIED. USING A REGULARLY CALIBRATED TORQUE WRENCH. TORQUE VALUES SPECIFIED IN THIS TECHNICAL PUBLICATION ARE FOR HENDRICKSON SUPPLIED FASTENERS ONLY. IF NON-HENDRICKSON FASTENERS ARE USED, FOLLOW TORQUE SPECIFICATION LISTED IN THE VEHICLE MANUFACTURER’S SERVICE MANUAL.

TORCH/WELDING

**WARNING**

DO NOT USE A CUTTING TORCH TO REMOVE ANY FASTENERS OR BUSHINGS. THE USE OF HEAT ON SUSPENSION COMPONENTS WILL ADVERSELY AFFECT THE STRENGTH OF THESE PARTS. A COMPONENT DAMAGED IN THIS MANNER CAN RESULT IN THE ADVERSE VEHICLE HANDLING AND POSSIBLE PERSONAL INJURY OR PROPERTY DAMAGE.

EXERCISE EXTREME CARE WHEN HANDLING OR PERFORMING MAINTENANCE IN THE AREA OF THE EQUALIZING BEAM. DO NOT CONNECT ARC WELDING GROUND LINE TO THE EQUALIZING BEAM. DO NOT STRIKE AN ARC WITH THE ELECTRODE ON THE EQUALIZING BEAM AND AXLE. DO NOT USE HEAT NEAR THE EQUALIZING BEAM ASSEMBLY. DO NOT NICK OR GOUGE THE EQUALIZING BEAM. SUCH IMPROPER ACTIONS CAN DAMAGE THE EQUALIZING BEAM ASSEMBLY AND CAUSE ADVERSE VEHICLE HANDLING AND POSSIBLE PERSONAL INJURY OR PROPERTY DAMAGE.

LOAD CAPACITY

**WARNING**

ADHERE TO THE PUBLISHED CAPACITY RATINGS FOR THE SUSPENSION. ADD-ON AXLE ATTACHMENTS AND OTHER LOAD TRANSFERRING DEVICES CAN INCREASE THE SUSPENSION LOAD ABOVE ITS RATED AND APPROVED CAPACITIES, WHICH CAN RESULT IN COMPONENT DAMAGE AND ADVERSE VEHICLE HANDLING, POSSIBLY CAUSING PERSONAL INJURY OR PROPERTY DAMAGE.

MODIFYING COMPONENTS

**WARNING**

DO NOT MODIFY OR REWORK PARTS WITHOUT AUTHORIZATION FROM HENDRICKSON. DO NOT USE SUBSTITUTE OR REPLACEMENT COMPONENTS NOT AUTHORIZED BY HENDRICKSON. USE OF MODIFIED, REWORKED, SUBSTITUTE OR REPLACEMENT PARTS NOT AUTHORIZED BY HENDRICKSON MAY NOT MEET HENDRICKSON’S SPECIFICATIONS, AND CAN RESULT IN FAILURE OF THE PART, ADVERSE VEHICLE HANDLING, AND POSSIBLE PERSONAL INJURY OR PROPERTY DAMAGE AND WILL VOID WARRANTY. USE ONLY HENDRICKSON AUTHORIZED REPLACEMENT PARTS.

PERSONAL PROTECTIVE EQUIPMENT

**WARNING**

ALWAYS WEAR PROPER EYE PROTECTION AND OTHER REQUIRED PERSONAL PROTECTIVE EQUIPMENT TO HELP PREVENT PERSONAL INJURY WHEN PERFORMING VEHICLE MAINTENANCE, REPAIR OR SERVICE.

PROCEDURES AND TOOLS

**CAUTION**

A TECHNICIAN USING A SERVICE PROCEDURE OR TOOL WHICH HAS NOT BEEN RECOMMENDED BY HENDRICKSON MUST FIRST SATISFY HIMSELF THAT NEITHER HIS SAFETY NOR THE VEHICLE’S SAFETY WILL BE JEOPARDIZED BY THE METHOD OR TOOL SELECTED. INDIVIDUALS DEVIATING IN ANY MANNER FROM THE INSTRUCTIONS PROVIDED WILL ASSUME ALL RISKS OF CONSEQUENTIAL PERSONAL INJURY OR DAMAGE TO EQUIPMENT INVOLVED.
**WARNING**

SUPPORT THE VEHICLE PRIOR TO SERVICING

PLACE THE VEHICLE ON A LEVEL FLOOR AND CHOCK THE WHEELS TO PREVENT THE VEHICLE FROM MOVING OR ROLLING. DO NOT WORK AROUND OR UNDER A RAISED VEHICLE SUPPORTED BY ONLY A FLOOR JACK OR OTHER LIFTING DEVICE. ALWAYS SUPPORT A RAISED VEHICLE WITH RIGID SAFETY STANDS. FAILURE TO DO SO CAN CAUSE SERIOUS PERSONAL INJURY OR DAMAGE TO EQUIPMENT.

**WARNING**

IMPROPER JACKING METHOD

IMPROPER JACKING METHODS CAN CAUSE STRUCTURAL DAMAGE WHICH CAN CAUSE ADVERSE VEHICLE HANDLING, PROPERTY DAMAGE OR SEVERE PERSONAL INJURY AND WILL VOID HENDRICKSON’S WARRANTY.

- DO NOT USE THE SUSPENSION CROSS TUBE AS A JACKING POINT, SEE FIGURE 3-1, REFER TO VEHICLE MANUFACTURER FOR PROPER JACKING INSTRUCTIONS.

- ACCEPTABLE LIFTING POINTS FOR A VEHICLE AT THE RATED LOAD INCLUDE BUT ARE NOT LIMITED TO: THE AXLE, EQUALIZING BEAM, AND THE VEHICLE FRAME RAIL. REFER TO THE VEHICLE MANUFACTURER FOR PROPER JACKING INSTRUCTIONS.

**FIGURE 3-1**

**CAUTION**

SADDLE CONNECTION

A SADDLE ASSEMBLY IS ATTACHED TO THE CENTER BUSHING OF EACH EQUALIZING BEAM WITH TWO (2) SADDLE CAPS. EACH SADDLE CAP USES TWO (2) BOLTS TO CLAMP THE CENTER BUSHING INNER METAL TO THE SADDLE. EACH SADDLE CAP MUST BE INSTALLED SO THAT THERE IS AN EVEN GAP BETWEEN THE SADDLE CAP AND THE BASE OF THE SADDLE LEGS AS SHOWN IN FIGURE 3-2. IF EACH SADDLE CAP IS NOT INSTALLED EVENLY, THE SADDLE LEGS COULD BECOME DEFORMED, RESULTING IN BENT BOLTS OR DAMAGED SADDLES.

**FIGURE 3-2**
**TORQUE ROD ASSEMBLY**

THE ULTIMAAX SUSPENSION INCORPORATES LONGITUDINAL AND TRANSVERSE TORQUE RODS FOR VEHICLE STABILITY. IF THESE COMPONENTS ARE DISCONNECTED OR ARE NON-FUNCTIONAL THE VEHICLE SHOULD NOT BE OPERATED. FAILURE TO DO SO CAN RESULT IN ADVERSE VEHICLE HANDLING AND POSSIBLE TIRE CONTACT WITH THE FRAME OR THE SUSPENSION.

**PARTS CLEANING**

SOLVENT CLEANERS CAN BE FLAMMABLE, POISONOUS, AND CAUSE BURNS. TO HELP AVOID SERIOUS PERSONAL INJURY, CAREFULLY FOLLOW THE MANUFACTURER’S PRODUCT INSTRUCTIONS AND GUIDELINES AND THE FOLLOWING PROCEDURES:

1. WEAR PROPER EYE PROTECTION.
2. WEAR CLOTHING THAT PROTECTS YOUR SKIN.
3. WORK IN A WELL-VENTILATED AREA.
4. DO NOT USE GASOLINE OR SOLVENTS THAT CONTAIN GASOLINE. GASOLINE CAN EXPLODE.
5. HOT SOLUTION TANKS OR ALKALINE SOLUTIONS MUST BE USED CORRECTLY. FOLLOW THE MANUFACTURER’S RECOMMENDED INSTRUCTIONS AND GUIDELINES CAREFULLY TO HELP PREVENT PERSONAL ACCIDENT OR INJURY.

DO NOT USE HOT SOLUTION TANKS OR WATER AND ALKALINE SOLUTIONS TO CLEAN GROUND OR POLISHED PARTS. DOING SO WILL CAUSE DAMAGE TO THE PARTS AND VOID WARRANTY.
SECTION 4

### Notes:
- * Item included in kit/assembly only, part not sold separately.
- ** Shock absorbers are mandatory for the tractor applications and optional for truck applications.
- *** Transverse torque rods are mandatory for the ULTIMAAX rear suspension regardless of axle spacing.

**Hendrickson Lit. Nos. 48422-592SP (Tractor) and 48422-598SP (Truck)** – ULTIMAAX Gauge Card can be used to measure in unloaded condition (1) the height of the progressive load spring (PLS) and (2) the length of cut / split of the shear spring and PLS.

  Hendrickson Part No. 66086-109
SECTION 6
Preventive Maintenance

Following appropriate inspection procedures is important to help ensure the proper maintenance and operation of the suspension system and component parts. Hendrickson recommends the ULTIMAAX severe-duty rear suspension be inspected at pre-delivery, the first in-service inspection and regular preventive maintenance intervals. Off-highway and severe service operating conditions may require more frequent inspections than on-highway service operation. Inspection must include the following items and other components referenced in this section.

NOTE
Torque values shown in this publication apply only if Hendrickson supplied fasteners are used. If non-Hendrickson fasteners are used, follow the torque specification listed in the vehicle manufacturer’s service manual.

<table>
<thead>
<tr>
<th>HENDRICKSON RECOMMENDED INSPECTION INTERVALS</th>
<th>PRE-DELIVERY INSPECTION</th>
<th>FIRST IN-SERVICE INSPECTION</th>
<th>PREVENTIVE MAINTENANCE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inspect progressive load spring (PLS)</td>
<td></td>
<td>Within the first 500 miles (500 km)</td>
<td>Every 3 Months / 600 Hours</td>
</tr>
</tbody>
</table>
| Visually Inspect proper assembly and function. Check for all of the following and replace components as necessary:  
  • Signs of unusual movement, loose or missing components  
  • Signs of abrasive or adverse contact with other components (example: brake lines, wheel wells, frame hangers, etc.)  
  • Damaged, or cracked parts  
  • Proper suspension function, alignment |                          | Within the first 1,500 miles (2,500 km) or 100 Hours | Every 6 Months / 1200 Hours or 25,000 miles / 40,000 km |
| Inspect torque rods and equalizing beam end connections |                          |                            | Every 12 Months / 2400 Hours |
| Inspect fasteners for proper torque as recommended in the Torque Specification Section of this publication with special attention to the following suspension connections:  
  • Equalizing beam end connection  
  • Saddle cap connection  
  • Frame hanger to frame rail connection  
  • Center bushing |                          |                            |                          |
| Verify the alignment of axles are within the vehicle manufacturer’s tolerances. |                          |                            |                          |

COMPONENT INSPECTION
Following appropriate inspection procedures is important to help ensure the proper maintenance and operation of the ULTIMAAX severe-duty rear suspension system and component parts. Look for and replace worn, damaged, bent or cracked parts.

■ Cross tube — Clean the cross tube and inspect it for cracks or excessive wear 8” to 10” from each end where it enters into the equalizing beam center bushings. Use a straight edge to check the straightness of the cross tube. If there is a doubt as to fracture, wear or straightness, replacement is necessary.
- **Equalizing beam assembly** — Check the overall condition of the equalizing beam for dents, dings, or other damage. Check the beam end connections for tearing or extreme bulging. Check for any metal-to-metal contact in the bushed joints. Refer to Equalizing Beam End Connection Inspection in this section.

- **Fasteners** — Look for any loose, missing or damaged fasteners on the entire suspension. Make sure all fasteners are tightened to a torque value within the specified torque range. See recommended torque specifications for Hendrickson supplied fasteners in Torque Specification Section of this publication. For fasteners not supplied by Hendrickson, see vehicle manufacturer. Use a calibrated torque wrench to check torque in the tightening direction. As soon as the fastener starts to move, record the torque. Correct the torque as necessary.

**NOTE**
Hendrickson recommends the use of Grade 8 bolts, hardened washers, and Grade C locknuts. Hardened washers are not necessary when flange head fasteners are used.

**NOTE**
Torque values shown in this publication apply only if Hendrickson supplied fasteners are used. If non-Hendrickson fasteners are used, follow the torque specification listed in the vehicle manufacturer’s service manual.

- **Saddle cap fasteners** — Inspect the locknuts for proper torque to prevent wear of the beam center bushing into the saddle. See Torque Specification Section of this publication for recommended torque requirements.

- **Shock absorbers** — Look for any signs of dents or leakage. Misting is not considered a leak. See Shock Absorber Inspection in this section.

- **Transverse torque rods / Longitudinal torque rods** — The torque rods must be connected and in good working condition when operating the vehicle.

- **Wear and damage** — Inspect all parts of the suspension for wear and damage. Look for bent or cracked parts. See vehicle manufacturer’s applicable publications for other preventive maintenance requirements.

## CENTER BUSHING

### VISUAL INSPECTION

An inspection of the center bushing is necessary **when a vehicle is in the shop for major repair work** and at regular preventive maintenance intervals.

**NOTE**
ULTIMAAX center bushing is designed with voids at front and rear, see Figure 6-1. These voids are not an indication of wear.

1. Visually inspect the center bushing for signs of movement or excessive wear such as frayed, bulging or distorted rubber in the center bushing.
2. Replacement is necessary if:
   - Any metal to metal contact is visible.
   - Any signs that the bushing inner metal is not centered in the bushing.
   - Any equalizing beam to saddle contact.
EQUALIZING BEAM END CONNECTION

An inspection of the beam end connections are necessary when a vehicle is in the shop for major repair work and at regular preventive maintenance intervals. Periodic visual inspection by the driver and service personnel is also recommended.

The beam end bushing for the ULTIMAAX is a bar pin style rubber bushing, see Figure 6-2.

NOTE

The equalizing beam end connection requires that the fasteners are tightened to torque specifications to maintain the clamp load of the axle bracket legs to the bar pin, see Figure 6-2. All bushing motion is accommodated by rubber deflection.

VISUAL INSPECTION

1. Chock the wheels.

2. Visually inspect suspension components for signs of movement or excessive wear.
   - Inspect alignment shims in equalizing beam end for looseness. Lightly tap on the alignment shims to see if they can be moved. If movement is detected, tighten fasteners to the proper torque value, see Figure 6-2.
   - Inspect the equalizing beam end connection for signs of excessive wear or looseness.

SERVICE HINT

An equalizing beam end connection that is visibly cleaner than the other connections may indicate a loose connection.

- Look for worn, frayed or distorted rubber in the bar pin beam end bushing, see Figure 6-3.
- Look for the equalizing beam to be lower in the beam hanger, see Figure 6-3.
- If the bar pin beam end bushing is visually offset a floor jack test should be performed, refer to Jack Test in this section.

A GOOD bushing will result in the equalizing beam end hub appearing to be centered with the centerline of the end bushing in the axle bracket

A WORN bushing will result in the equalizing beam end hub appearing to be ⅜" (15 mm) offset/below the centerline of the end bushing in the axle bracket
JACK TEST

1. Place a jack under each beam end as shown. Raise the jack to check for movement in the connection or rubber components, see Figure 6-4.

NOTE

The gap at each side of the visible rubber on the lower part of the end bushing is normal, see Figure 6-4, and is not an indication to replace the bushing. Because all rubber end bushings are in compression, with the load bearing on the top side, the lower side of the rubber is slightly relieved, allowing the rubber to move inward, and a gap appears.

PHYSICAL INSPECTION

WARNING

IF BAR PIN MOVEMENT OR LOoseness IS NOTED IN ANY OF THE EQUALIZING BEAM END HUBS, DO NOT OPERATE THE VEHICLE. REPLACE THE RUBBER END BUSHINGS AND ALL CONNECTING PARTS IF NECESSARY. THE ABOVE CONDITION CAN RESULT IN COSTLY REPAIR, DOWNTIME, POSSIBLE SEPARATION OF COMPONENTS, ADVERSE VEHICLE HANDLING, PROPERTY DAMAGE, OR PERSONAL INJURY.

SERVICE HINT

An equalizing beam end connection that is visibly cleaner than the other connections may indicate a loose connection.

2. If bar pin end bushing movement or looseness is detected in the equalizing beam end hub, replace the end bushings and all connecting parts. Refer to the Component Replacement Section of this publication.

3. Check and record torque values, as received, for each 1” bar pin fastener, see Figure 6-2. Ensure all fasteners are tightened to:
   - At the locknut to $525 \pm 75$ foot pounds torque, or
   - At the bolt head to $575 \pm 75$ foot pounds

4. Recheck equalizing beam end connections for signs of looseness.
   - Inspect alignment shims in equalizing beam end for looseness. Lightly tap on the alignment shims to see if they can be moved. If movement is detected, tighten fasteners to the proper torque value, see Figure 6-2.
   - Inspect equalizing beam end connection for signs of excessive wear or looseness.

5. If bar pin looseness is still detected in any of the equalizing beam end hub, DO NOT operate the vehicle. One or more components will require replacement, see Component Replacement Section of this publication.

BAR PIN STYLE END BUSHINGS

VISUAL INSPECTION

An indication that the bar pin end bushing requires replacement is when one or more of the following conditions apply:

- If the contact area, see Figure 6-5 (the flat face area where bar pin contacts the axle bracket) reveals signs of excessive wear. A bar pin thickness measurement of less than $1\frac{3}{8}$” (47.59 mm).
- If the bar pin bolt holes bores reveal signs of elongation or wear, see Figure 6-5.
BART PIN SHIMS

An indication that the bar pin shims require replacement is when one or more of the following conditions apply:

- Visual inspection of contact area on the shim reveals signs of excessive wear.
- The thickness of any single leg on the shim, is less than the measurement shown in Figure 6-6, replacement of bar pin shim is required.

![Figure 6-6: Bar Pin Shims](image)

**Original Thickness Of Shim Leg** | **Minimum Thickness Required** | **Part Number**
---|---|---
$\frac{1}{8}'' (3.2 \text{ mm})$ | 0.123'' (3.1 mm) | 50131-000
$\frac{3}{16}'' (4.8 \text{ mm})$ | 0.186'' (4.7 mm) | 50130-000
$\frac{1}{4}'' (6.4 \text{ mm})$ | 0.248'' (6.3 mm) | 50131-000
$\frac{3}{8}'' (9.5 \text{ mm})$ | 0.371'' (9.4 mm) | 57026-000

BEAM END AXLE BRACKETS

**NOTE**

The axle brackets are furnished and welded into position by the vehicle manufacturer or axle manufacturer.

**VISUAL INSPECTION**

When inspecting the equalizing beam end connection also inspect the axle brackets for damage or cracks, see Figures 6-7 and 6-8. Any axle bracket that is found damaged or cracked must be repaired or replaced.

Consult the axle and/or vehicle manufacturer for additional inspections, component repair and replacement instructions.

**PHYSICAL INSPECTION**

a. Inspect the axle brackets for damage or cracks in the locations shown in Figures 6-7 and 6-8. Any axle bracket that is found damaged or cracked must be repaired or replaced.

b. Measure the distance between the axle bracket legs for correct width, refer to Figures 6-7 and 6-8 for measurement location and dimensions. An axle bracket outside of the measurement range must be repaired or replaced.

c. Consult the vehicle manufacturer for inspection, component repair and replacement instructions.

![Figure 6-7: Beam End Axle Brackets](image)

**NOTE:** Typical axle brackets shown

- Look for cracks in these locations
  - $2.29'' \pm 0.025'' (58.11 \text{ mm} \pm 0.63 \text{ mm})$

- Typical location of crack areas
  - $8.5'' \pm 0.1'' (216 \text{ mm} \pm 2.6 \text{ mm})$
FRAME HANGER ASSEMBLY
The following points are for guidance and intended to assist personnel in determining when frame hanger assembly maintenance is necessary.

INSPECTION
- Inspect the frame hanger for any damage, cracks or signs of adverse or abrasive contact with other components. Some minor wear will be evident where the progressive load spring contacts the frame hanger assembly, see Figure 6-9. If more than half the thickness of the frame hanger plate is damaged or cracked, replace the frame hanger assembly.
- Look for wear in the frame hanger cavity due to contact with the jounce stop, see Figure 6-9. If more than half the thickness of the frame hanger plate is worn or damaged, replace the frame hanger.
- Inspect the frame hanger attaching fasteners and frame hanger assembly for signs of looseness or movement. Re-tighten any loose fasteners to specified torque. Components damaged by loose fasteners must be replaced.

FIGURE 6-9

SHEAR SPRINGS
INSPECTION
Always inspect the shear spring with the vehicle in the UNLOADED condition.
- Bent or burred edges on the rate plates extending beyond the rubber are acceptable provided the rubber can freely expand during vehicle operation, see Figure 6-10.
- Creases formed by folding of the rubber surface under load are acceptable. These appear as stripes on the surface, polished by wear or covered with tacky (sticky) rubber, see Figure 6-11.

FIGURE 6-10

FIGURE 6-11

Polished Appearance — Creases formed by the folding of the rubber surface under load are acceptable.
Bonding separation of the rubber from any of the bonded rate plate surfaces to a maximum depth of approximately 2" (50 mm) is acceptable, see Figure 6-12. If the bonding separation depth is 2" (50 mm) or more, the shear springs require replacement.

A certain amount of gradual breakup of the rubber surface is acceptable. Use a feeler gauge to measure cuts or splits in the rubber. If the measurement is over a depth of 2" (50 mm), then the shear springs require replacement, see Figures 6-13 and 6-14.

**PROGRESSIVE LOAD SPRINGS (PLS)**

**NOTE**

The Hendrickson ULTIMAAX suspension progressive load springs must be replaced in pairs (left side pairs or right side pairs or rear position pairs or front position pairs), even if only one PLS shows unacceptable conditions. Replacement of only one PLS can cause uneven wear, and higher premature wear for the one replaced.

Visually inspect the progressive load springs at regular preventive maintenance intervals. The following points are for guidance and intended to assist personnel in determining when progressive load spring component requires replacement, refer to the Component Replacement Section of this publication.

**SERVICE HINT**

Use Hendrickson gauge card (Lit. No. 48422-592SP for Tractor) or (Lit. No. 48422-598SP for Truck) in unloaded condition to help determine the height, length of cut or split and depth of separation of the ULTIMAAX progressive load spring (PLS), see Figure 6-15.

Always inspect the progressive load spring with the vehicle in the **UNLOADED** condition.

- The height of a new PLS is:
  - **Tractor** – 3¼" (78 mm) • **Truck** – 2¾" (73 mm)

- The PLS requires replacement if the height is below, see Figure 6-16:
  - **Tractor** – 2½" (59 mm) • **Truck** – 2¾" (55 mm)
A bent or cracked mounting base requires PLS replacement.

If any cuts or splits in the rubber of over 2" (50 mm) in length and an average depth of ½" (13 mm), the effected PLS requires replacement. A certain amount of gradual breakup of the rubber surface is normal. The most likely areas for potential cuts, splits, or wear are shown in Figure 6-16 as "[/ / /] / / / /".

If any bonding separation depth of the rubber from the PLS mounting base plate surface (see Figure 6-16) is more than a ½" (13 mm), the effected PLS requires replacement.

Creases formed by folding of the rubber surface under load are acceptable. These appear as stripes on the surface, polished by wear or covered with tacky rubber, see Figure 6-17.

![Figure 6-15](image1)

![Figure 6-16](image2)

![Figure 6-17](image3)
**SADDLE CONNECTION**

Visually inspect for any signs of movement or looseness and ensure:

- Each saddle is centered on each equalizing beam center bushing.
- The center bushing inner metal is full seated to the saddle.
- Saddle cap locknuts are tightened to proper torque as specified in the Torque Specifications Section of this publication.

**Saddle cap fasteners** — While tightening the saddle cap fasteners maintain an even gap between the saddle and saddle cap, see Figure 6-18.

**NOTE**

Tightening the saddle cap fasteners properly will help prevent wear of mating components.

**FIGURE 6-18**

**CROSS TUBE**

The ULTIMAAX cross tube connects the two (2) equalizing beams through the equalizing beam’s center bushings, see Figure 6-19. The cross tube has clearance to float side-to-side in the center bushings.

The length of the cross tube will allow side-to-side movement of approximately 2½” (60 mm). For this reason, the cross tube may appear polished or missing paint at each end where it enters into the center bushings. This is normal. Also, the cross tube will rattle in straight position which is acceptable.

**DO NOT** grease or lubricate the cross tube or the center bushing and **DO NOT** use the cross tube as a jacking point, see Figure 6-19.

**FIGURE 6-19**
WARNING

IMPROPER JACKING METHODS CAN CAUSE STRUCTURAL DAMAGE WHICH CAN CAUSE ADVERSE VEHICLE HANDLING, PROPERTY DAMAGE OR SEVERE PERSONAL INJURY AND WILL VOID HENDRICKSON’S WARRANTY.

■ DO NOT USE THE SUSPENSION CROSS TUBE AS A JACKING POINT, REFER TO VEHICLE MANUFACTURER FOR PROPER JACKING INSTRUCTIONS.
■ ACCEPTABLE LIFTING POINTS FOR A VEHICLE AT THE RATED LOAD INCLUDE BUT ARE NOT LIMITED TO: THE AXLE, EQUALIZING BEAM, AND THE VEHICLE FRAME RAIL. REFER TO THE VEHICLE MANUFACTURER FOR PROPER JACKING INSTRUCTIONS.

VISUAL INSPECTION

NOTE

A bent cross tube may cause misalignment of the axles, which may cause abnormal tire wear.

■ Visually inspect the overall condition of the cross tube for dents, dings, or bent condition, replace as necessary.
■ Use a straight edge to inspect the straightness of the cross tube, replace as necessary

TORQUE RODS

WARNING

THE ULTIMAAX SUSPENSION INCORPORATES TORQUE RODS FOR VEHICLE STABILITY. IF THESE COMPONENTS ARE DISCONNECTED OR ARE NON-FUNCTIONAL THE VEHICLE SHOULD NOT BE OPERATED. FAILURE TO DO SO CAN RESULT IN ADVERSE VEHICLE HANDLING AND POSSIBLE TIRE CONTACT WITH THE FRAME OR THE SUSPENSION.

VISUAL INSPECTION

All transverse and longitudinal torque rods need to be inspected during preventive maintenance and service for looseness.

Visually inspect (1) torque rod bushings for any torn or shredded rubber material interfaces or elongated oval shapes and (2) torque rods for any metal to metal contact, bent, cracked or broken components. The torque rod and/or the torque rod bushings will require replacement if any of these conditions are encountered.

Torque rod looseness inspection is necessary. With the vehicle shut down, a lever check can be made with a long pry bar (36") placed under each torque rod end and pressure applied.

Torque rod length is determined by the original vehicle manufacturer (see Figure 6-20). The mounting bracket at the axle housing end of the torque rods are furnished and welded into position on the axle housings by the axle or vehicle manufacturer,

NOTE

Hendrickson Suspension recommends Grade 8 bolts, hardened flat washer and Grade C locknuts be used for all straddle mount torque rod attachments.

■ It is important that the tightening torque of the locknuts be checked during preventive maintenance and service. Follow the tightening torque specifications and all applicable preventive maintenance, service and safety instructions issued by the respective vehicle and suspension manufacturers.
SHOCK ABSORBERS

NOTE
It is not necessary to replace shock absorbers in pairs if only one (1) shock absorber requires replacement.

Hendrickson uses a long service life, premium shock absorber on all ULTIMAAX suspensions. When the shock absorber replacement is necessary, Hendrickson recommends that the shock absorbers be replaced with identical Hendrickson Genuine parts for servicing. Failure to do so will affect the suspension performance, durability, and will void any applicable warranty. See vehicle manufacturer’s applicable publications for other shock absorber inspection requirements.

Inspection of the shock absorber can be performed by doing a heat test, and a visual inspection. Replace as necessary, refer to the Component Replacement Section of this publication.

HEAT TEST INSPECTION

1. Drive the vehicle at moderate speeds on rough road for minimum of fifteen minutes.

**WARNING**
DO NOT GRAB THE SHOCK ABSORBER AS IT COULD POSSIBLY BE HOT AND CAUSE PERSONAL INJURY.

2. Use an infrared thermometer to check the temperature of the shock absorber. This can also be performed by carefully touching the shock absorber body below the dust cover. Touch the frame to get an ambient reference, see Figure 6-19. A warm shock absorber is acceptable, a cold shock absorber should be replaced.

3. To inspect for an internal failure, remove and shake the suspected shock absorber. Listen for the sound of metal parts rattling inside. Rattling of metal parts can indicate that the shock absorber has an internal failure and the shock absorber should be replaced.

VISUAL INSPECTION

Look for these potential problems when doing a visual inspection. Inspect the shock absorbers fully extended. Replace as necessary.

SHOCK ABSORBER VISUAL INSPECTION - UNACCEPTABLE CONDITIONS

- Damaged upper or lower mount
- Damaged upper or lower bushing
- Damaged dust cover and/or shock body
- Bent or dented shock
- Improper installation: Example: washers (if equipped) installed backwards.
LEAKING VS. MISTING SHOCK ABSORBER VISUAL INSPECTION

The inspection must not be conducted after driving in wet weather or a vehicle wash. The shock absorber needs to be free from water. Many shock absorbers are often misdiagnosed as failures. Misting is the process whereby very small amounts of shock absorber fluid evaporate at a high operating temperature through the upper seal of the shock absorber. When the "mist" reaches the cooler outside air, it condenses and forms a film on the outside of the shock absorber body. Misting is perfectly normal and necessary function of the shock absorber. The fluid which evaporates through the seal area helps to lubricate and prolong the life of the seal.

NOTE

ULTIMAAX systems are equipped with a premium seal on the shock absorber, however this seal will allow for misting to appear on the shock absorber body (misting is not a leak and is considered acceptable).

Inspect the shock absorber fully extended. A shock absorber that is truly leaking will show signs of fluid leaking in streams from the upper seal. These streams can easily be seen, underneath the main body (dust cover) of the shock absorber. Replace as necessary.
SECTION 7
Alignment & Adjustments

AXLE ALIGNMENT
- The primary control for axle alignment is the location of the frame hanger assemblies on the frame rail as installed by the vehicle manufacturer, and the location of the axle brackets on the axles as installed by the axle or vehicle manufacturer.
- Axle centering and pinion angles are controlled by the torque rods.
- Ride height is controlled by the design of the suspension frame hanger. No adjustment is possible.

DRIVE AXLE PINION ANGLE
Drive axle pinion angles are established by the vehicle manufacturer. If pinion angle adjustment is required, check for proper angles with the vehicle manufacturer. Pinion angle is set by the longitudinal torque rod length.

TO CHECK THE PINION ANGLE
1. Use a work bay with a level floor.
2. Relax the suspension by slowly moving the vehicle back and forth several times in a straight line without using the brakes. This will slacken or loosen the suspension as the vehicle is positioned. End with all wheels positioned straight ahead. Roll to a stop without the brakes being applied. DO NOT set the parking brake.
3. Chock the front wheels of the vehicle.
4. Place a digital protractor on the axle housing as shown in Figure 7-1.
5. Check to see if the pinion angle is correct per the vehicle manufacturer’s specified range.
6. If necessary, add/remove shims at the longitudinal torque rod connections as required to achieve the proper pinion angle.
7. When the pinion angle is correct tighten all fasteners to the proper torque specifications per the vehicle manufacturer and recheck the pinion angles.
8. Remove wheel chocks.

DRIVE AXLE ALIGNMENT

NOTE
Drive axle alignment with suspensions equipped with adapter style equalizing beam end connections ARE NOT adjustable.

Computerized alignment equipment is the preferred method of measuring alignment. To calculate the shim thickness required, the target offset must be converted to thrust angle, see alignment equipment manufacturer for procedures. If, however, computerized axle alignment equipment is not available refer to the following Inspection in this section.
Proper alignment is essential for maximum ride quality, performance, and tire service life. The following recommended alignment procedure as described below, should be performed if excessive or irregular tire wear is observed.

NOTE

Proper vehicle alignment can only be achieved when all axles are aligned to the vehicle’s centerline and the steering axle’s caster, camber and toe-in settings are within specifications.

INSPECTION

1. Use a work bay with a level, flat surface.
2. Relax the suspension by slowly moving the vehicle back and forth several times in a straight line. This will slacken or loosen the suspension as the vehicle is positioned. End with all wheels positioned straight ahead.
3. **DO NOT** set the parking brake. Chock the front wheels of the vehicle.
4. Verify the vehicle system air is at full operating pressure.
5. Verify all suspension components are in good condition. Repair or replace any worn or damaged suspension components before proceeding with the alignment process.
6. Ensure all drive axle tires are at the same size.
7. Securely clamp a six-foot piece of STRAIGHT bar stock or angle iron across the lower frame flange as shown in Figure 7-2. Select a location for the bar stock or angle iron as far forward of the drive axle as possible where components will not interfere.
8. Accurately square the bar stock or angle iron to the frame using a carpenter’s square.
9. Using a measuring tape, measure from the straight edge to the forward face of the front drive axle arms on both sides of the vehicle as shown in Figure 7-2, dimensions A and B.
10. Calculate the difference between measurements A and B.
   a. If the front drive axle is within vehicle manufacturer’s specifications, proceed to check the rear drive axle (Step 11).
   b. If alignment of the front drive axle IS NOT within the vehicle manufacturer’s specifications, then the alignment of this axle MUST be corrected BEFORE measuring the rear drive axle alignment (Step 11).
   c. If the suspension is equipped with bar pin end bushings, correct the alignment of this axle by following the bar pin alignment instructions in this section.

NOTE

Since the remaining drive axle will be aligned relative to the front drive axle, it is essential that the front drive axle is aligned within the vehicle manufacturer’s specifications prior to the alignment of the remaining drive axle.

11. Using a trammel bar, measure the distance from the spindle center of the front drive axle to the spindle center of the rear drive axle on both sides of the vehicle; see Figure 7-2, C and D.
12. Calculate the difference between measurements C and D.
   a. If the measurements are within the vehicle manufacturer’s specifications, then the rear drive axle alignment is acceptable.
   b. If alignment of the rear drive axle IS NOT within the vehicle manufacturer’s specifications, then the alignment of this axle MUST be corrected.
   c. If the suspension is equipped with bar pin end bushings, correct the alignment of this axle by following the Bar Pin with Shims Alignment instructions in this section.
13. Recheck measurements to confirm adjustments. Repeat Steps 10 through 12 until the correct alignment is achieved.
14. After all drive axles are aligned, check the pinion angle of each drive, refer to the Axle Pinion Angle in this section.
AXLE LATERAL ALIGNMENT

1. Use a work bay with a level floor.
2. Drive the vehicle slowly, straight ahead. Try to slacken or loosen the suspension as the vehicle is positioned. End with all wheels positioned straight ahead. Try to roll to a stop without the brakes being used. DO NOT set the parking brake.
3. Chock the front wheels of the vehicle.
4. Measure from the outside of the frame rail to the rim flange of the inner tire. Record the measurement A and B, see Figure 7-3.
5. Measure the same distance on the opposite side of the same axle. Record the measurement C and D, see Figure 7-3.
6. Verify the axle lateral alignment is within the vehicle manufacturer’s specifications. Adding or removing shims that are located between the transverse torque rod and the frame rail will normally correct the axle lateral alignment.
   - A general rule of thumb is to use a torque rod shim with a thickness that is half of the difference between the two measurements.

EXAMPLE
If the axle lateral alignment is out of specification by ¼” (6 mm), remove or install a ½” (3 mm) torque rod shim between the transverse torque rod and frame rail as needed. Refer to Longitudinal and Transverse Torque Rod Section in Preventive Maintenance Section of this publication.

NOTE
Hendrickson recommends the use of Grade 8 bolts and Grade C locknuts. Washers are not necessary when flanged fasteners are used.

BAR PIN ALIGNMENT

The alignment feature consists of specially designed, tightly tolerance steel shims which fill the ⅜” (9.5 mm) total gap between the bushing’s bar pin and the axle bracket legs. The gap must be filled by placing the shims on the bushing assembly in one of the positions shown in Figure 7-4. Hendrickson has three shim designs options for alignment, part number 50130-000 (provided), 50131-000 and 57026-000, see Figure 7-7.

A BAR PIN SHIM MUST BE INSTALLED AT EACH BOLT LOCATION. THE SAME PART NUMBER SHIM IN THE SAME ORIENTATION MUST BE USED AT BOTH BOLT LOCATIONS ON ANY ONE END BUSHING. DO NOT INSTALL OR STACK MORE THAN ONE SHIM AT EACH BOLT LOCATION. USE GENUINE HENDRICKSON BAR PIN SHIMS, DO NOT USE STANDARD WASHERS. FAILURE TO FOLLOW THESE WARNINGS MAY RESULT IN IMPROPER VEHICLE ALIGNMENT, FRACTURE OF THE AXLE BRACKET OR BAR PIN WHICH COULD RESULT IN THE ADVERSE VEHICLE HANDLING AND POSSIBLE PERSONAL INJURY OR PROPERTY DAMAGE.
ALIGNMENT ADJUSTMENT

If alignment of the drive axles is required, as determined by an alignment inspection procedure, the following steps will need to be performed.

1. Determine direction of axle thrust angle. Figure 7-5 illustrates the forward drive axle with a thrust angle to the left (negative thrust).

SERVICE HINT

Axle movement is in the same direction as the increased shim thickness, see Figure 7-6.

2. To determine where to adjust shim thickness use measurement A and B for front drive axle or C and D for rear drive axle, see Figure 7-2.

SERVICE HINT

Axle adjustment will be on the side of the bar pin where shim thickness is increased. For example, to correct the axle thrust angle illustrated in Figure 7-5, shim thickness will need to be increased at the front of the bar pin (Location X) and/or the rear of the bar pin (Location Y).

NOTE

Computerized alignment equipment is the preferred method of measuring alignment. To calculate the shim thickness required the target offset must be converted to thrust angle, see alignment equipment manufacturer for procedures.

3. Chock the wheels of the front axles to prevent vehicle movement during service.

4. Raise the frame of the vehicle to remove the load from the suspension. Support the frame at this height.

5. Support the equalizing beam and remove the fasteners from the end bushing where the bar pin alignment shim adjustment is being made.

6. Adjust shim thickness to move the axle in the desired direction, see Figure 7-6.

WARNING

EACH EQUALIZING BEAM END BUSHING HAS ONE INBOARD AND ONE OUTBOARD ALIGNMENT SHIM, FOR A TOTAL OF FOUR SETS OF TWO ALIGNMENT SHIMS PER SUSPENSION. EACH SET OF ALIGNMENT SHIMS FOR A PARTICULAR BEAM END BUSHING MUST BE INSTALLED IN THE SAME ORIENTATION. SHIM ORIENTATION MAY DIFFER FOR EACH BEAM END BUSHING, SEE FIGURE 7-4. FAILURE TO FOLLOW THESE WARNINGS MAY RESULT IN THE FRACTURE OF EITHER THE AXLE BRACKET OR BAR PIN WHICH COULD RESULT IN THE ADVERSE VEHICLE HANDLING AND POSSIBLE PERSONAL INJURY OR PROPERTY DAMAGE.

WARNING

THE BAR PIN ALIGNMENT SHIM (PART NO. 50130-000) MUST BE INSTALLED WITH THE FOLDED EDGE FACING AWAY FROM THE BUSHING, SEE FIGURE 7-7. FAILURE TO DO SO MAY RESULT IN SHIM DAMAGE, IMPROPER ALIGNMENT, DAMAGE OR FRACTURE OF THE AXLE BRACKET OR BAR PIN WHICH COULD RESULT IN THE ADVERSE VEHICLE HANDLING AND POSSIBLE PERSONAL INJURY OR PROPERTY DAMAGE.

7. Install new end bushing fasteners and tighten to:

- At the locknut to 525 ± 75 foot pounds torque, or
- At the bolt head to 575 ± 75 foot pounds torque
8. Remove support and lower the vehicle.
9. Verify the axles’ alignments are within the vehicle manufactures tolerance.
10. Set brakes and remove wheel chocks.

Example: The alignment equipment shows the front drive axle to have a 0.40° thrust angle to the left. This will require a ¼" (6.4 mm) shim thickness increase to the front side of the left front equalizing beam end bushing. If there is less than ¼" (6.4 mm) of adjustment available at this location then some of the adjustment will have to be made at the rear of the right front end bushing. In this case a ⅛" (3.2 mm) shim thickness increase at the front side of the left front bar pin and a ⅛" (3.2 mm) shim thickness increase at the rear side of the right front bar pin will correct the 0.40° thrust angle.
SECTION 8
Component Replacement

FASTENERS
When servicing an ULTIMAAX suspension, Hendrickson recommends replacing all removed fasteners with new genuine Hendrickson fasteners. Maintain correct torque values at all times. Check torque values as specified, see Hendrickson’s Torque Specifications Section of this publication. If non-Hendrickson fasteners are used follow torque specifications listed in the vehicle manufacturer’s service manual.

NOTE
Torque values shown in this publication apply only if Hendrickson supplied fasteners are used. If non Hendrickson fasteners are used, follow the torque specification listed in the vehicle manufacturer’s service manual.

SHOCK ABSORBER (If Equipped)

NOTE
Shock absorbers are mandatory for the tractor applications and optional for truck applications.

NOTE
It is not necessary to replace shock absorbers in pairs if one shock absorber requires replacement.

DISASSEMBLY
1. Chock the front wheels of the vehicle.
2. Remove the lower shock absorber nylon locknut, retainer washer and rubber bushing from the shock absorber stud, see Figure 8-1.
3. Remove the upper shock fasteners from the upper shock bracket, see Figure 8-1.
4. Remove shock absorber.

ASSEMBLY
1. Mount the shock absorber in the upper shock bracket and install fasteners, tighten to 170 ± 20 foot pounds torque, see Figure 8-1.
2. Locate the shock absorber stud in the lower shock bracket and install the rubber bushing, retainer washer and nylon locknut. Tighten to 80 ± 10 foot pounds torque, see Figure 8-1.
3. For vehicles not originally equipped with shock absorber:
   a. Use the upper shock bracket as a guide to drill the top mounting hole in the frame rail, see Figure 8-2.
   b. Install the top mounting hole fasteners and tighten to the vehicle manufacturer’s torque specifications.
4. Remove the wheel chocks.
SHEAR SPRING / FRAME HANGER ASSEMBLY / SADDLE ASSEMBLY

You will need:
- Saddle Disassembly Tool Part No. 66086-113L and Saddle Assembly Tool Part No. 66086-108L, see Special Tools Section of this publication.

DISASSEMBLY

1. Chock the front wheels of the vehicle.
2. Raise and support the drive axles on safety stands.
3. Remove the drive tires from the side of the vehicle being serviced.
4. Remove and discard the M16 saddle cap fasteners that attach the saddle assembly to the center bushing, see Figure 8-3.
5. Raise the vehicle’s frame just enough to create a ½” (13 mm) gap between the saddle assembly and center bushing. Support the vehicle’s frame at this height on safety stands.
6. Remove the progressive load springs M10 fasteners and discard, see Figure 8-5.
7. Remove the progressive load springs.
8. Apply NLGI #2–EP (Extreme Pressure) chassis lubricant to the threaded rod of the Saddle Disassembly Tool Part No. 66086-113L, see Figure 8-4.

NOTE

The threaded rod spacer and spacer nut are designed and orientated to fit into the saddle assembly openings, see Figure 8-6.

9. Install both Saddle Disassembly Tool on each end of one saddle assembly, rotate the threaded rod blocking nuts until each are oriented properly into the saddle assembly openings, see Figures 8-5 and 8-6.
SERVICE HINT

Use rachet strap attached to each saddle half and the frame or vehicle body to secure the saddle halves during removal.

10. Snug the Saddle Disassembly Tool.

NOTE

The shear springs are in each frame hanger are compressed when installed.

11. Remove and discard the M20 saddle fasteners, see Figure 8-7.
12. To separate the two saddle halves, evenly rotate the threaded rod nut to tighten the Saddle Disassembly Tool, see Figure 8-7.

FIGURE 8-7

13. Remove the saddle halves and / or shear springs for replacement.

**CAUTION**

EACH FRAME HANGER ASSEMBLY WEIGHS APPROXIMATELY 104-130 POUNDS (47-59 KILOGRAMS). USE APPROPRIATE LIFTING DEVICES TO REMOVE OR INSTALL THE FRAME HANGER ASSEMBLY. FAILURE TO DO SO CAN RESULT IN DAMAGE TO THE VEHICLE OR PERSONAL INJURY.

14. If replacing the frame hanger, remove the frame fasteners per the vehicle manufacturer’s instructions. Remove frame hanger.

ASSEMBLY

1. If installing a new frame hanger continue to Step 2. If installing or servicing shear springs or saddle assembly, proceed to Step 3.

**CAUTION**

EACH FRAME HANGER ASSEMBLY WEIGHS APPROXIMATELY 104-130 POUNDS (47-59 KILOGRAMS). USE APPROPRIATE LIFTING DEVICES TO REMOVE OR INSTALL THE FRAME HANGER ASSEMBLY. FAILURE TO DO SO CAN RESULT IN DAMAGE TO THE VEHICLE OR PERSONAL INJURY.

2. Position the frame hanger assembly against the frame rail. Install fastener’s per the vehicle manufacturer’s instructions and specifications.

SERVICE HINT

During assembly, it may be necessary to use tape to hold the shear springs in position. After installation is complete remove tape.

3. Position the shear springs with the flanged flat side against the frame hanger with the shear spring angled downward, see Figure 8-8.
4. Apply NLGI #2–EP (Extreme Pressure) chassis lubricant to the threaded rod of the Saddle Assembly Tool Part No. 66086-108L, see Figure.

**NOTE**
The threaded rod spacer and spacer nut are designed and orientated to fit into the saddle assembly openings.

5. Apply P-80 lubricant to the shear spring’s angled face and to the mating face of the saddle halves, see Figure 8-10.

6. On each side of the saddle assemblies, rotate the threaded rod spacers and spacer nuts of the saddle assembly tool until each are oriented properly into the saddle assembly openings, see Figure 8-11.

**SERVICE HINT**
Use a mechanism to attach to the frame to aid in holding the saddle up while performing procedure (such as a strap or rope) attached to each saddle half and the frame or the vehicle body to secure the saddle halves during installation or have an additional person assist to align the saddle halves properly.

7. Position the inner saddle half into the frame hanger along with the shear springs, outer saddle half, see Figure 8-12.

8. Bring both saddle halves together with the Saddle Assembly Tool. Evenly tightening the Saddle Assembly Tool until both saddle halves are seated against each other.
9. Install the new M20 saddle fasteners. Tighten in the proper sequence shown in Figure 8-13 to a 325 foot pounds plus a 90° rotation, or 560 ± 30 foot pounds torque.
10. Remove temporary tape from the shear springs if used during assembly.
11. Remove the Saddle Assembly Tool.
12. Install the progressive load springs.
13. Install the progressive load spring M10 fasteners. Tighten to 30 ± 2 foot pounds torque.
14. Remove the frame supports.
15. Lower the frame of the vehicle while engaging and centering the saddles on the equalizing beam’s center bushings, see Figure 8-14.

A SADDLE ASSEMBLY IS ATTACHED TO THE CENTER BUSHING OF EACH EQUALIZING BEAM WITH TWO (2) SADDLE CAPS. EACH SADDLE CAP USES TWO (2) BOLTS TO CLAMP THE CENTER BUSHING INNER METAL TO THE SADDLE. EACH SADDLE CAP MUST BE INSTALLED SO THAT THERE IS AN EVEN GAP BETWEEN THE SADDLE CAP AND THE BASE OF THE SADDLE LEGS AS SHOWN IN FIGURE 8-15. IF EACH SADDLE CAP IS NOT INSTALLED EVENLY, THE SADDLE LEGS COULD BECOME DEFORMED, RESULTING IN BENT BOLTS OR DAMAGED SADDLES.

CAUTION

Tightening the saddle cap fasteners properly will help prevent wear of mating components, such as the beam center bushing, saddle, and saddle cap.

16. While tightening the saddle cap fasteners, maintain an even gap between the saddle and saddle cap, see Figure 8-15.

17. Install the saddle cap fasteners and tighten evenly in several steps to 200 ± 20 foot pounds torque in proper sequence to achieve uniform bolt tension, see Figure 8-16.

18. Install the tires.

19. Remove supports from the axles and lower the vehicle onto the ground.

20. Remove the wheel chocks.
NOTE
The Hendrickson ULTIMAAX suspension progressive load springs must be replaced in pairs (left side pairs or right side pairs or rear position pairs or front position pairs), even if only one PLS shows unacceptable conditions. Replacement of only one PLS can cause uneven wear, and higher premature wear for the one replaced.

DISASSEMBLY
1. Chock the front wheels of the vehicle.
2. Raise the vehicle’s frame until the saddle assembly contacts the bottom of the frame hanger assembly. Support the vehicle’s frame at this height with safety stands.
3. Remove and discard the M10 fasteners that attach the progressive load springs to the saddle assembly.
4. Remove the progressive load springs from the frame hanger assembly.

ASSEMBLY
1. Install the progressive load springs into the frame hanger assembly.
2. Install four M10 flange bolts that attach the PLS to the saddle assembly. The flange bolts must be installed with the locknuts facing downward as shown in Figure 8-17.
3. Tighten the PLS fasteners to $30 \pm 2$ foot pounds torque.
4. Remove the frame safety stands and lower the vehicle.
5. Remove the wheel chocks.

EQUALIZING BEAM

DISASSEMBLY
1. Chock the wheels of the steer axle.
2. Raise and support the drive axles with safety stands.
3. Remove the tires.
4. Support the pinion angle of the drive axles to prevent axle movement during service.
5. Remove the saddle cap bolts from both inboard and outboard side of each equalizing beam.
6. Remove the saddle caps, see Figure 8-18.
7. Raise the vehicle’s frame just enough to create a $1/2" \ (13 \text{ mm})$ gap between the saddles and the center bushings. Support the vehicle’s frame at this height with safety stands.

WARNING
THE WEIGHT OF THE EQUALIZING BEAM ASSEMBLY IS APPROXIMATELY 218 POUNDS (99 KILOGRAMS). PRIOR TO REMOVING THE END BUSHING BOLTS FROM THE EQUALIZING BEAM, SUPPORT THE END OF THE EQUALIZING BEAM TO PREVENT IT FROM DROPPING. CARE SHOULD BE TAKEN AT REMOVAL AND INSTALLATION TO PREVENT PERSONAL INJURY OR DAMAGE TO COMPONENTS.
8. Support both equalizing beams under the center bushing with floor jacks.

**NOTE**
Prior to disassembly of the equalizing beam bar pin fasteners, note the orientation of the bar pin alignment shims, see Figure 8-19. It is required that the bar pin alignment shims are installed in the same orientation and location as removed to preserve the existing vehicle alignment. Improper vehicle alignment can increase tire wear.

9. Note the orientation and location of the bar pin shims, see Figure 8-19.
10. Remove and discard end bushing fasteners.

**SERVICE HINT**
The center bushing will allow the cross tube and the equalizing beam to angle downward once the equalizing beam end fasteners are removed.

11. Slowly lower the floor jacks and remove the equalizing beams from the axle brackets.

**WARNING**
PRIOR TO REMOVING BOTH EQUALIZING BEAMS, SUPPORT THE PINION OF EACH DRIVE AXLE. FAILURE TO DO SO CAN RESULT IN PERSONAL INJURY OR ALLOW THE AXLES TO SHIFT MAKING REASSEMBLY MORE DIFFICULT.

12. Slide the equalizing beams off the cross tube and out from under the vehicle.
13. Remove the floor jacks from under the equalizing beams.
ASSEMBLY

1. Position the equalizing beams under the axles with floor jacks.

SERVICE HINT

Ensure the equalizing beam’s center bushing end plug is located on the outboard side of the equalizing beam, see Figure 8-17.

2. Install the cross tube into the center bushings of both equalizing beams.

SERVICE HINT

Increasing or decreasing the pinion angle may help align the axle bracket and the equalizing beam end bushings.

WARNING

THE WEIGHT OF THE EQUALIZING BEAM ASSEMBLY IS APPROXIMATELY 218 POUNDS (99 KILOGRAMS). CARE SHOULD BE TAKEN AT REMOVAL AND INSTALLATION TO PREVENT PERSONAL INJURY OR DAMAGE TO COMPONENTS.

3. Using the floor jacks, slowly raise both equalizing beams and cross tube as an assembly into the axle brackets. Ensure each equalizing beam end bushing correctly engages its respective axle bracket.

4. Install bar pin shims in the correct orientation and location.

5. Install new equalizing beam end fasteners into both beams. Tighten the equalizing beam end fasteners to:

   ■ at the locknuts 525 ± 75 foot pounds or
   ■ at the bolt head 575 ± 75 foot pounds torque

6. Remove the frame supports.

7. Lower the frame of the vehicle while engaging and centering the saddles on the equalizing beam’s center bushings, see Figure 8-20.

CAUTION

A SADDLE ASSEMBLY IS ATTACHED TO THE CENTER BUSHING OF EACH EQUALIZING BEAM WITH TWO (2) SADDLE CAPS. EACH SADDLE CAP USES TWO (2) BOLTS TO CLAMP THE CENTER BUSHING INNER METAL TO THE SADDLE. EACH SADDLE CAP MUST BE INSTALLED SO THAT THERE IS AN EVEN GAP BETWEEN THE SADDLE CAP AND THE BASE OF THE SADDLE LEGS AS SHOWN IN FIGURE 8-21. IF EACH SADDLE CAP IS NOT INSTALLED EVENLY, THE SADDLE LEGS COULD BECOME DEFORMED, RESULTING IN BENT BOLTS OR DAMAGED SADDLES.
NOTE

Tightening the saddle cap fasteners properly will help prevent wear of mating components, such as the beam center bushing, saddle, and saddle cap.

8. While tightening the saddle cap fasteners at the bolt head, maintain an even gap between the saddle and saddle cap, see Figure 8-21.

9. Install the saddle cap fasteners and tighten evenly in several steps to 200 ± 20 foot pounds torque in proper sequence to achieve uniform bolt tension, see Figure 8-22.

10. Install the tires.
11. Remove supports from the axles and lower the vehicle onto the ground.
12. Remove the wheel chocks.

EQUALIZING BEAM CENTER BUSHING

You will need:
- Vertical shop press with a capacity of at least 100 Tons (90 metric tones).
- Center bushing tools – Receiving Tool Part No. 66086-112, Installation Tool Part No. 66086-107 and Removal Tool Part No. 66086-110, see Special Tools Section of this publication.

DISASSEMBLY

1. Remove the equalizing beam assembly from the vehicle. Follow the equalizing beam disassembly procedure in this section.

DO NOT USE A CUTTING TORCH TO REMOVE ANY FASTENERS OR BUSHINGS. THE USE OF HEAT ON SUSPENSION COMPONENTS WILL ADVERSELY AFFECT THE STRENGTH OF THESE PARTS. A COMPONENT DAMAGED IN THIS MANNER CAN RESULT IN THE ADVERSE VEHICLE HANDLING AND POSSIBLE PERSONAL INJURY OR PROPERTY DAMAGE.

2. Place the equalizing beam assembly in a shop press with the center hub firmly supported on the receiving tool or on the press, see Figure 8-23.

3. Install the center bushing removal tool, ensure it is centered on the center bushing.

4. Push directly on center bushing removal tool until the center bushing is pressed out of the equalizing beam bore, see Figure 8-23.

5. Inspect the beam bore.

INSPECTION

After removing the center bushing, thoroughly inspect the beam bore. If damaged, replace with a new equalizing beam. DO NOT attempt to re-bush or use an equalizing beam that has been damaged.
**WARNING**

FAILURE TO REPLACE AN EQUALIZING BEAM THAT HAS BEEN DAMAGED FROM BUSHING REMOVAL CAN RESULT IN THE FAILURE OF THAT BEAM, LEADING TO ADVERSE VEHICLE HANDLING AND POSSIBLE PERSONAL INJURY OR PROPERTY DAMAGE.

When installing new center bushings the following steps will minimize the chance of damaging a new bushing:

1. Clean the bore of the equalizing beam with emery cloth or ball hone, removing any nicks or metal buildup from bushing removal.

2. Measure the inside diameter of the equalizing beam center bore. The specification for the inside diameter of the equalizing beam center bore on a new ULTIMAAX equalizing beam is 3.886" ± 0.003" (98.7 mm ± 0.1 mm), calculate the mean of any two measurements 90° apart in the same plane, see Figure 8-24. If the mean is **NOT** within the specified range, replacement of the equalizing beam is required.

**NOTE**

Always use the bushing outer metal for pressing operations. Pressing on the bushings inner metal may damage the bushing and require bushing replacement.

**ASSEMBLY**

1. The equalizing beam bore may have a more substantial lead in chamfer at one end of the bore than the other, see Figure 8-25. Take advantage of the larger chamfer by pressing in the new bushing from this end.

2. Place the equalizing beam in a shop press on the receiving tool or press. Support the beam squarely at the center bore area to avoid distortion of the beam bore or bending of the beam.

3. Lubricate the equalizing beam bore and the equalizing beam center bushing outer metal sleeve with an NLGI#2-EP (Extreme Pressure) grease, see Figure 8-26.

**NOTE**

The center bushing must be square with the equalizing beam hub before pressing the center bushing into the beam. Center bushings pressed in at an angle will damage the center bushing and the equalizing beam.

**CAUTION**

ALWAYS USE THE CENTER BUSHING OUTER METAL FOR PRESSING OPERATIONS. PRESSING ON THE CENTER BUSHING’S INNER METAL WILL CAUSE DAMAGE TO THE CENTER BUSHING AND REQUIRE CENTER BUSHING REPLACEMENT.

**NOTE**

The ULTIMAAX center bushing has voids that must be positioned horizontally front and back, see Figure 8-27.
4. Install the center bushing installation tool, Part no. 66086-107, making sure the voids are positioned horizontally front and back and press in the new center bushing until the outer metal sleeve is centered in the equalizing beam bore, see Figures 8-27 and 8-30.

5. Wipe off excess grease from around the installed center bushing.

6. Install the equalizing beam assembly to the vehicle. Follow the equalizing beam installation procedure in this section.
EQUALIZING BEAM END BUSHINGS

You will need:
- A shop press with a capacity of at least 100 Tons
- End bushing service kit, refer to the Parts List Section of this publication.
- End bushing tools – Receiving Tool Part No. 66086-111, Installation Tool Part No. 66086-106 and Removal Tool Part No. 66086-109, see Special Tools Section of this publication.

DISASSEMBLY

**WARNING**
WHEN REMOVING AND INSTALLING BUSHINGS IN THE EQUALIZING BEAMS, FOLLOW THE PROCEDURES OUTLINED IN THIS PUBLICATION. DO NOT USE A CUTTING TORCH TO REMOVE THE BUSHING OUTER METALS PRESSED IN THE BEAM BORES OR FASTENERS, WELDING, TORCHING OR ATTACHING MATERIAL TO THE EQUALIZING BEAM MUST NEVER BE PERFORMED. THE USE OF HEAT CAN ADVERSELY AFFECT THE STRENGTH OF THE EQUALIZING BEAMS AND CAN CAUSE DAMAGE TO THE EQUALIZING BEAM ASSEMBLY, ADVERSE VEHICLE HANDLING AND POSSIBLE PERSONAL INJURY OR PROPERTY DAMAGE.

**WARNING**
DISCARD USED FASTENERS. ALWAYS USE NEW FASTENERS TO COMPLETE A REPAIR. FAILURE TO DO SO COULD RESULT IN FAILURE OF THE PART OR MATING PARTS, ADVERSE VEHICLE HANDLING, PERSONAL INJURY, OR PROPERTY DAMAGE.

**NOTE**
Hendrickson recommends the use of Grade 8 bolts, hardened washers, and Class C locknuts. Hardened washers are not necessary when flange head fasteners are used.

**NOTE**
Whenever an equalizing beam is removed for repair or inspection of the equalizing beam end connection reveals movement, measure the distance between the axle bracket legs for correct width. Refer to Axle Bracket in Preventive Maintenance Section of this publication for measurement location and dimensions. An axle bracket outside of the measurement range must be repaired or replaced. Consult the vehicle manufacturer for inspection, component repair and replacement instructions.

1. Remove equalizing beam assembly from vehicle as detailed in the equalizing beam disassembly instructions in this section.

2. Place the equalizing beam in the shop press with the beam end hub squarely supported on the receiving tool (Part No. 66086-111) or press bed.

3. Prior to removal, mark the orientation of the bar pin flats on the equalizing beam with a paint stick, see Figure 8-31.

4. Support the beam end hub with it centered on the receiving tool. Be sure the equalizing beam is squarely supported on the press bed for safety.

5. Press on the end bushing inner metal, see Figure 8-31, of the end bushing until the inner metal is flush with the top of the equalizing beam end hub. This will move the bushing rubber away from the outer metal of the bushing so the removal tool (Part No. 66086-109) can be installed.

6. Center the bushing removal tool directly on the bushing’s outer metal and press the bushing out of the equalizing beam end hub.
INSPECTION
After removing the bar pin end bushings, thoroughly inspect the beam bores. If the equalizing beam is damaged from end bushing removal, replacement of the equalizing beam is required, replace with a new equalizing beam. DO NOT attempt re-bush or use an equalizing beam that has been damaged.

**WARNING**
FAILURE TO REPLACE AN EQUALIZING BEAM THAT HAS BEEN DAMAGED FROM BUSHING REMOVAL CAN RESULT IN THE FAILURE OF THAT BEAM, ADVERSE VEHICLE HANDLING AND POSSIBLE PERSONAL INJURY OR PROPERTY DAMAGE.

1. Clean the bores of the equalizing beams with emery cloth or ball hone, removing any nicks or metal buildup from bushing removal.

2. Measure the equalizing beam end hub bore inner diameter. The Hendrickson specification for the equalizing beam end hub bore diameter is 4.621" ± 0.004" (117.38 mm ± 0.10 mm), and is taken as the mean of any two readings 90° apart in the same plane, see Figure 8-32. If it is NOT within the specified range, replacement is required.

ASSEMBLY

**NOTE**
Always use the bushing outer metal for pressing operations. Pressing on the bushings inner metal may damage the bushing and require bushing replacement.

1. The equalizing beam bore may have a more substantial lead in chamfer at one end of the bore than the other. Take advantage of the larger chamfer by pressing in the new end bushing from this end.

2. Lubricate the equalizing beam end hub inside bore and the bar pin end bushing outer sleeve with a NLGI #2 – EP (Extreme Pressure) grease.

3. Place the equalizing beam in a shop press with the end hub, squarely supported on the receiving tool, see Figure 8-33.

4. Position and align the end bushing to the mark made before removal as shown in Figure 8-31.

**NOTE**
The end bushing must be square with the equalizing beam end hub before pressing the end bushing into the beam. End bushings pressed in at an angle will damage the end bushing and the equalizing beam.

**CAUTION**
CARE MUST BE TAKEN DURING THE INSTALLATION OF THE BUSHING. DO NOT PUSH ON THE INNER METAL OF THE BUSHING, DOING SO WILL CAUSE DAMAGE TO THE BUSHING AND VOID WARRANTY.

**NOTE**
Always use the bushing outer metal for pressing operations. Pressing on the bushings inner metal may damage the bushing and require bushing replacement.
5. Place the end bushing installation tool on the end hub.
6. The through hole in the tool can help align the bar pin flats due to lack of visibility. Place a bolt with enough length to go through the tool and the bar pin hole, see Figure 8-34.
7. With the tools align, press in the end bushing, see Figure 8-33.
8. The end bushing must be centered within the hub of the equalizing beam, see Figure 8-35.
9. Install the equalizing beam assembly into vehicle as detailed in equalizing beam assembly in this section.

**CROSS TUBE**

A cross tube seldom requires replacement, usually only when it has been bent, possibly due to hitting an object. A bent cross tube may cause misalignment of the axles, and must be replaced immediately to eliminate abnormal tire wear.

**METHOD A EQUALIZING BEAM REMOVAL**

Follow the procedure in the Equalizing Beam Component Replacement procedure in this section. Within the procedure, after removal of the equalizing beams when the equalizing beams are separated, remove and replace cross tube.

**METHOD B CENTER BUSHING END PLUG REMOVAL**

You will need:
- Cross Tube Service Kit 60961-759 (see Parts Lists Section)
- Cutting Torch
- Welding Equipment and
- Hole Saw

**DISASSEMBLY**

1. Use a work bay with a level surface.
2. Chock the front steer axle wheels.

**CAUTION**

FOLLOW THE SAFETY GUIDELINES FOR OPERATING THE TORCH. USE CAUTION AS PARTS MAY BE HOT.

3. Use a cutting torch to make two cuts in the cross tube, see Figure 8-36.
4. Remove the cut section of the cross tube and slide the remaining sections out of the center bushings and discard.
5. Remove only one center bushing end plug from the suspension using a 2" (50.8 mm) hole saw.
ASSEMBLY
1. Clean the open end of the center bushing bore to approximately 1" (25.4 mm) depth of weld and debris.
2. From the open center bushing slide the new cross tube into both center bushings.
3. It may be necessary to use a floor jack under one or both equalizing beams to align the cross tube.
4. Once the new cross tube has been inserted, position the end plug ¼" (6.6 mm) recessed in the center bushings and tack weld, see Figure 8-37.
5. Check end plug position, final weld shall be a ¼" (6.6 mm) fillet.

FIGURE 8-37
LONGITUDINAL TORQUE RODS

**WARNING**
THE ULTIMAAX SUSPENSION INCORPORATES LONGITUDINAL TORQUE RODS FOR VEHICLE STABILITY. IF THESE COMPONENTS ARE DISCONNECTED OR ARE NON-FUNCTIONAL THE VEHICLE SHOULD NOT BE OPERATED. FAILURE TO DO SO CAN RESULT IN ADVERSE VEHICLE HANDLING AND POSSIBLE TIRE CONTACT WITH THE FRAME OR THE SUSPENSION.

**DISASSEMBLY**
1. Chock the front wheels of the vehicle.

**SERVICE HINT**
To remove all the load from the longitudinal torque rod, raise or lower the pinion as needed. This will ease the removal of the longitudinal torque rod.
2. Support the pinion on the axle being serviced.

**NOTE**
Prior to disassembly of the longitudinal torque rod, note the quantity and orientation of the longitudinal torque rod shims. It is required that the longitudinal torque rod shims are installed in the same orientation and location as removed to preserve the existing alignment.
3. Remove the torque rod mounting fasteners and shims (if equipped).
4. Remove the fasteners that connect the longitudinal torque rod to the cross member and axle brackets.
5. Remove longitudinal torque rod from the vehicle, see Figure 8-38.

**ASSEMBLY**
1. Install longitudinal torque rod.
2. Install the fasteners and any shims that were removed to the cross member and axle brackets.

**NOTE**
Hendrickson recommends the use of Grade 8 bolts and Grade C locknuts. If flange head bolts and locknuts are not used then hardened structural washers must be used under bolt heads and locknuts.
3. Tighten all fasteners to vehicle manufacturer’s torque specifications.
4. Verify proper pinion angle, and correct with drop in shims between the torque rod bar pin and the cross member or axle bracket depending on the direction of adjustment needed. Contact the vehicle manufacturer for proper pinion angle specifications.
5. Remove wheel chocks.

**FIGURA 8-38**

---

Transverse Torque Rod

Longitudinal Torque Rod

Straddle Bushing

1½"-12 UNF Taper Pin Bushing Locknut
Tightening Torque 200 ± 25 ft.lbs (271 ± 34 Nm)

5/8"-11 UNC Taper Pin Bushing Bolt Head
Tightening Torque 65 ± 5 ft.lbs (88 ± 7 Nm)
TRANSVERSE TORQUE RODS

THE ULTIMAAX SUSPENSION INCORPORATES TRANSVERSE TORQUE RODS FOR VEHICLE STABILITY. IF THESE COMPONENTS ARE DISCONNECTED OR ARE NON-FUNCTIONAL THE VEHICLE SHOULD NOT BE OPERATED. FAILURE TO DO SO CAN RESULT IN ADVERSE VEHICLE HANDLING AND POSSIBLE TIRE CONTACT WITH THE FRAME OR THE SUSPENSION.

DISASSEMBLY

1. Chock the front wheels of the vehicle.

SERVICE HINT

Note the quantity and location of shims removed to maintain the lateral alignment of the axle during assembly. See Alignment & Adjustments Section of this publication.

2. Remove the torque rod mounting fasteners.
3. Remove the transverse torque rod from the vehicle, see Figure 8-38.
4. Inspect the mounting surfaces for any wear or damage. Repair or replace as necessary.

ASSEMBLY

1. Install the transverse torque rod.
2. Install the mounting fasteners and any shims that were removed.

NOTE

Hendrickson recommends the using Grade 8 bolts and Grade C locknuts for all torque rod attachments.

3. Prior to tightening, ensure that the vehicle is at the proper ride height. Tighten all fasteners to the required torque specification. Refer to original equipment manufacturer for specifications.
4. Check the lateral alignment. If not within vehicle manufacturer’s specified range, a lateral alignment is necessary. See Lateral Alignment in the Alignment & Adjustments Section of this publication.
5. Remove the wheel chocks.
SECTION 9
Torque Specifications

HENDRICKSON RECOMMENDED TORQUE VALUES PROVIDED
IN FOOT POUNDS AND IN NEWTON METERS

1. 200 ± 20 ft. lbs
   (270 ± 30 Nm)

2. 30 ± 2 ft. lbs
   (41 ± 3 Nm)

3. 325 ft. lbs (440 Nm)
   + 90° Rotation
   OR
   560 ± 30 ft. lbs
   (760 ± 40 Nm)

4a. 525 ± 75 ft. lbs
    (712 ± 102 Nm)

4b. 575 ± 75 ft. lbs
    (780 ± 102 Nm)

5a. 200 ± 25 ft. lbs
    (271 ± 34 Nm)

5b. 65 ± 5 ft. lbs
    (88 ± 7 Nm)

6. 80 ± 10 ft. lbs
   (109 ± 19 Nm)

7. 170 ± 20 ft. lbs
   (231 ± 27 Nm)
